Overall Economic Activity

This analysis of the United States economy begins with the most popular measure of economic activity, Gross Domestic Product (GDP). According to the Bureau of Economic Analysis, GDP–the seasonally-adjusted annualized value of goods and services produced in the US–was $21,537 billion in the first quarter of 2020, compared to an inflation-adjusted equivalent of $9,896 billion in the first quarter of 1989.

The US population is growing by about sixth-tenths of a percent per year. GDP per capita (see –), adjusted for inflation to 2020 Q1 dollars, has increased to $65,360 in 2020 Q1 from $40,526 in 1989 Q1.

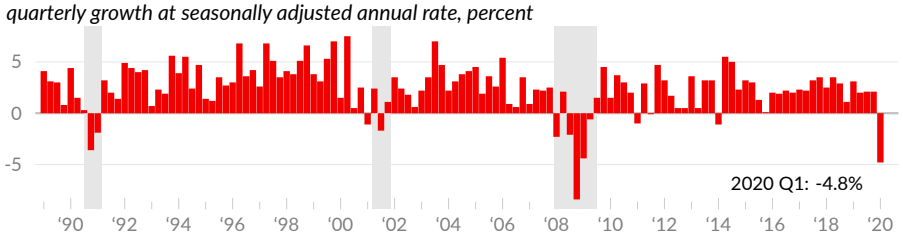
GDP per capita
in 2020 Q1 dollars

Source: Bureau of Economic Analysis

Economic Growth

GDP (see ■) decreased at an annual rate of -4.8 percent during the first quarter of 2020, compared to an increase of 2.1 percent in the fourth quarter of 2019. This annualized rate of quarterly growth has averaged 2.0 percent over the past three years, 2.1 percent over the past 10 years, and 2.4 percent over the past 30 years.

Real Gross Domestic Product Growth
quarterly growth at seasonally adjusted annual rate, percent

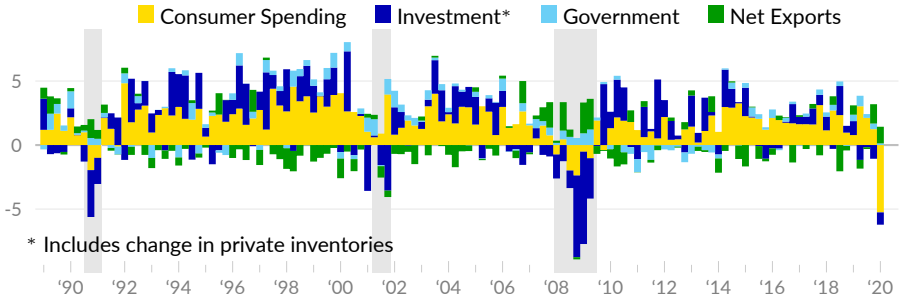


Source: Bureau of Economic Analysis

Components of Growth

The **expenditure approach** compiles GDP from the sum of spending on domestic goods and services. Major spending categories are consumer spending (see ■), private investment (gross spending on capital goods) and changes in private inventories (see ■), government spending and investment (see ■), and net exports (see ■) which is measured as foreign spending on US goods and services less US spending on goods and services produced by the rest of the world.

Real GDP Growth by Expenditure Type
percentage point contribution to GDP growth

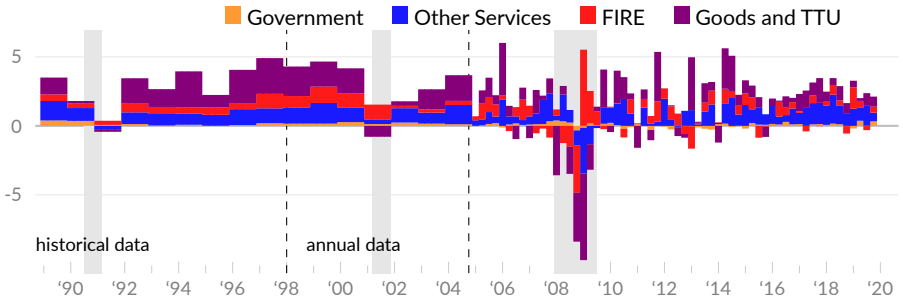


Source: Bureau of Economic Analysis

The **production approach** calculates GDP as the sum of gross value added–output minus inputs–in each sector. This identifies contributions from: goods-producing sectors combined with trade, transportation, and utilities (see), finance, insurance, and real estate (see), other service-providing sectors (see), and government (see).

Real GDP Growth by Industry Group

percentage point contribution to GDP growth

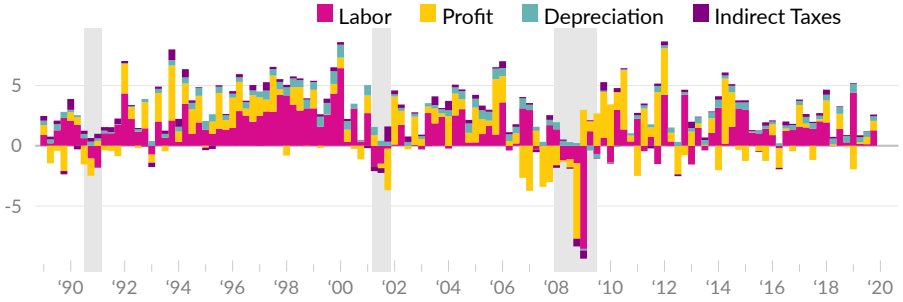


Source: Bureau of Economic Analysis

The **income approach** calculates GDP as the sum of market income to persons (in exchange for labor (see) or from returns on capital (see)), indirect taxes such as sales taxes or tariffs (see), and depreciation (see).

Real Gross Domestic Income Growth

percentage point contribution to GDI growth



Source: Bureau of Economic Analysis

Changes to GDP can be assigned to changes in **household inputs**: population (see), employment rates (see), average hours worked (see), and total economy productivity (see).

Real GDP Growth by Inputs

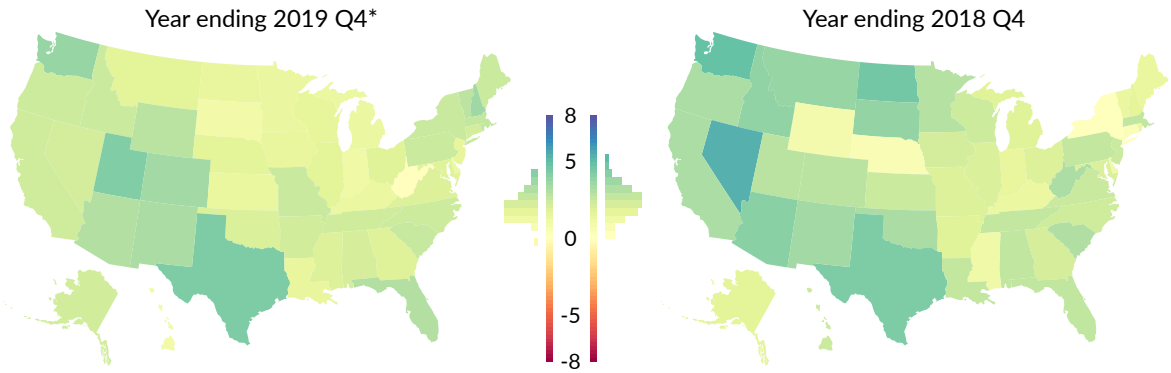
Real GDP Growth by State

percentage point change in real GDP



Source: Bureau of Economic Analysis

*For the year ending 2019 Q4, no states had real GDP growth of more than five percent, 27 states had real GDP growth between two and five percent, 23 states had less than two percent GDP growth, and one state (West Virginia) had negative GDP growth.

Real GDP Growth by State

Financial Accounts

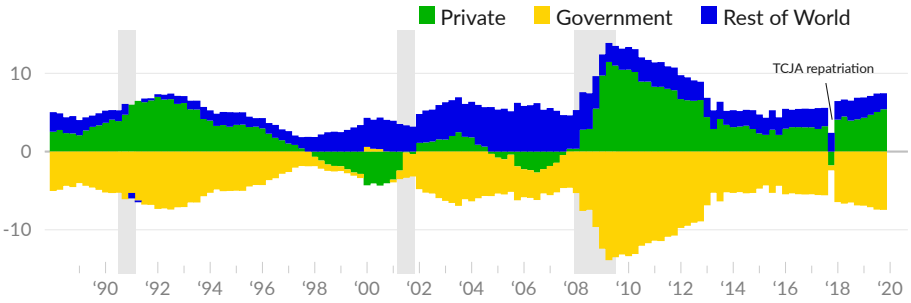
The Federal Reserve reports the balances and transactions in the US **financial accounts**. This includes the flow of funds between sectors in the economy and the various components of balance sheets by sector, such as for households, businesses, and government. The sector-specific data are covered in the section of the chartbook that corresponds to the sector, however, the overall financial activities of the US are discussed in this section.

Sectoral Balances

A high-level overview of US financial activities can be provided by dividing the world economy into three sectors: the US private sector (see ■), the US government (see ■), and the rest of the world (see ■), then examining the net lending and borrowing between the groups, which must sum to zero at an aggregate level. That is, if one sector is running a deficit, another sector must be running a surplus.

Sectoral Financial Balance

net lending (+) or borrowing (-), NIPA basis, by sector, as share of GDP



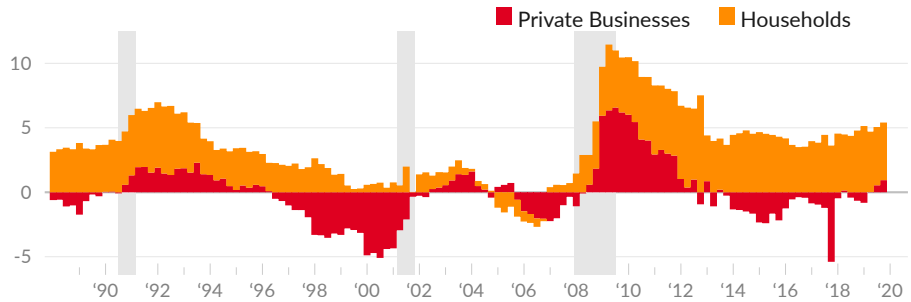
Source: Bureau of Economic Analysis

In 2019 Q4, the US private sector was a net lender (running a surplus) of the equivalent of 5.4 percent of GDP, substantially above the 2.3 percent surplus in 2015 Q1. The rest of the world was a net lender to the US, to the equivalent of 2.0 percent of GDP in 2019 Q4 compared to 2.4 percent in 2015 Q1. Balancing these transactions, the government (federal, state, and local combined) was a net borrower (running a deficit) of the equivalent of 7.5 percent of GDP, compared to 4.7 percent in 2015.

Within the private sector, households were net lenders of the equivalent of 4.5 percent of GDP in 2019 Q4 (see ■), while the net financial balance of private businesses–corporate and noncorporate–was equivalent to 0.9 percent of GDP (see ■).

Domestic Private Sector Financial Balance

net lending (+) or borrowing (-), NIPA basis, by sector, as share of GDP



Source: Bureau of Economic Analysis

Liabilities

The contribution of different sectors to the **total change in borrowing** can identify potential risks in the domestic economy. For example, the tech bubble of the late 1990s and early 2000s shows up as a large increase in corporate borrowing. The housing bubble from the 1990s to 2007 shows up as an increase in household borrowing. Government borrowing increased following the collapse of the housing bubble, in an effort to compensate for the massive fall in wage income. Keep in mind, however, that the vast majority of liabilities in the domestic economy are to other domestic parties.

Domestic liabilities increased by 4.4 percent over the year ending 2019 Q4, after adjusting for inflation. Over the past three years, total domestic liabilities increased at an average annual rate of 3.0 percent. The federal government contributed 0.8 percentage point per year on average (see ■), while the state and local government subtracted 0.1 percentage point per year on average (see ■). Households and nonprofits contributed an annual average of 0.3 percentage point over this three year period (see ■), corporate businesses contributed 1.5 percentage points per year on average (see ■), and non-corporate businesses contributed 0.5 percentage point per year on average (see ■).

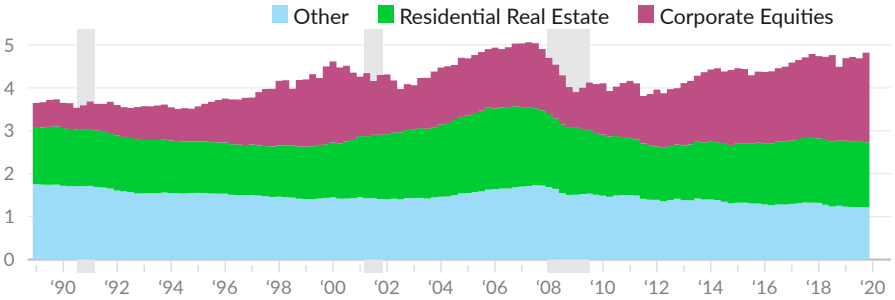
Wealth

Total US wealth is the tangible assets of all non-corporate sectors of the US, plus the market value of domestic corporate equities, less US financial obligations to the rest of the world. The ratio of US total wealth, excluding public lands, to GDP increased to 4.82 in 2019 Q4 from 3.65 in 1989 Q1. The market value of corporate equities (see ■) increased to a 2.09 multiple of GDP in 2019 Q4 from 0.56 in 1989 Q1. The market value of residential real estate (see ■) increased to 1.51 times GDP from 1.33 in 1989. The other category (see ■), which includes tangible assets other than residential real estate less US financial obligations to the rest of the world, decreased to 1.22 from 1.76 in 1989.

Total US Wealth to GDP Ratio

total US wealth divided by GDP



Source: Federal Reserve

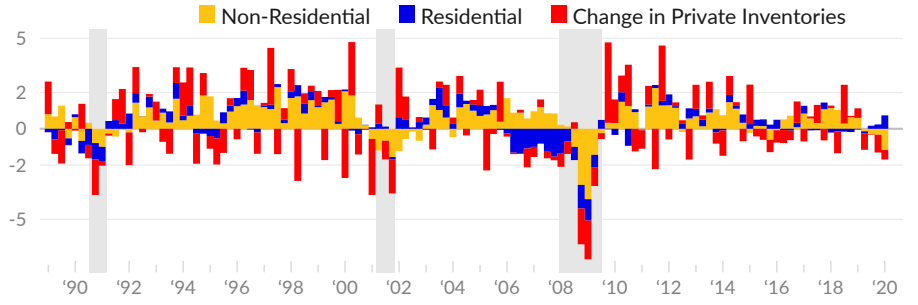
Investment

Private fixed investment, as measured in the national accounts, includes residential fixed investment, such as the construction and improvement of houses, apartment buildings, and other residential property (see ■), but does not include spending on durable goods, such as automobiles, appliances, or furniture. Non-residential private fixed investment includes the construction and improvement of offices, warehouses, factories, and other commercial and industrial property (see ■), as well as purchases of equipment, software, and intellectual property products. Additionally, the change in private inventories (see ■) at the end of the accounting period, whether intentional or unintentional, affects GDP growth in the period. Inventory investment is grouped in the national accounts with gross private investment, but is not fixed investment.

In the first quarter of 2020, private fixed investment, which does not include inventory investment, totals $3.7 trillion, equivalent to 17.0 percent of GDP. Non-residential (business) fixed investment totals $2.8 trillion, or 13.0 percent of GDP, while residential fixed investment totals $862.0 billion (4.0 percent of GDP). During the quarter, private fixed investment subtracted 0.43 percentage point from real GDP growth. Non-residential fixed investment subtracted 1.17 percentage points, while residential fixed investment contributed 0.74 percentage point. The change in private inventories subtracted 0.53 percentage point.

Private Fixed Investment

percentage point contribution to real GDP growth



Source: Bureau of Economic Analysis

Households

This section covers the household sector of the economy loosely defined, and touches on demographics, personal income and outlays, residential fixed investment, household balance sheets, home ownership, housing prices, and housing construction and permitting.

Demographics and Household Formation

The **total US population** is 329 million. The Census divides the population into those living in households (about 97 percent of the total) and those living in **group quarters**, such as prisons (1.5 million people), jails (750,000 people, of which 480,000 are pre-trial), nursing homes (1.3 million people), barracks (around 300,000), dormitories (around 2.6 million), group homes (300,000), and shelters (200,000). The numbers for group quarters populations are likely low estimates, as they are derived from older sources than the population estimate. The 2020 Census will provide detailed information on the exact share of each population in each category of living arrangement.

Among those living in **households**, roughly 74 million are children under the age of 18, 198 million are age 18 to 64, and 53 million are age 65 or older. These numbers and the group quarters populations do not sum to the total population because of differences in sources as well as some overlap between the two categories, particularly for those in school dormitories.

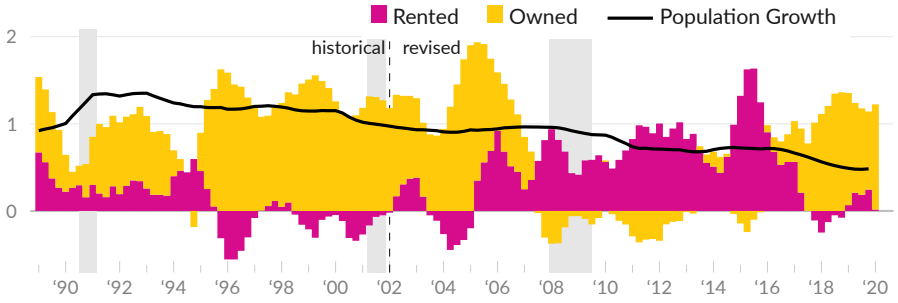
Household Formation

Household formation, measured here as the one-year change in total occupied housing units, can result from a net increase in renters or a net increase in homeowners. Household formation should keep pace with population growth, all else equal. During the housing bubble, the home-ownership rate increased and household formation exceeded population growth. Following the collapse of the housing bubble, housing formation was often below population growth. Additionally, home ownership decreased as foreclosures converted homeowners into renters.

As of 2020 Q1, there are 124.4 million total occupied housing units in the US, of which 43.1 million (34.7 percent) are rented, and 81.3 million (65.3 percent) are owner-occupied. There was an average annual net total increase of 1.5 million housing units over the year ending 2020 Q1, the result of 18 thousand net new renter households and 1.5 million net new owner-occupied households. Over the year ending 2020 Q1, the total number of occupied housing units increased by 1.2 percent, compared to an increase of 1.1 percent in 2019 Q4. Owner-occupied units contributed 1.2 percent to total household formation on average over the year (see), compared to a contribution of 0.2 percent from rented units (see).

Household Formation by Type

one-year moving average of annual growth rates, percent



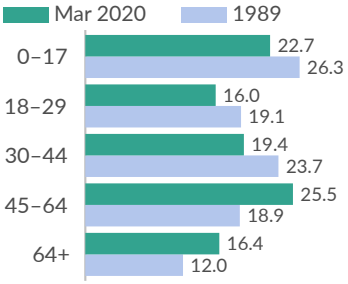
Source: Census Bureau, Housing Vacancies and Homeownership

Age

In discussions on demographics, **aging** is often described as a serious headwind to economic growth in major advanced economies. The increased share of many countries' population that is of retirement age means a smaller share are working and borrowing and a larger share are receiving pension benefits and lending to the financial system. These trends can be overcome by a workforce that is more efficiently able to provide goods and services. In part due to a shorter life-expectancy in the US, this problem is more pronounced in Japan and western Europe, but is still an important issue for the US.

Age

share of population, percent



Source: Author's calculations from CPS

The CPS civilian non-institutionalized population is 324 million in the year ending March 2020, with growth of 0.3 percent over the past year, though other Census population growth estimates are around 0.6 percent. By age, 22.7 percent are under the age of 18 and 16.4 percent are age 65 or older. In 1989, the US population was 244 million, with 26.3 percent under 18 and 12.0 percent 65 or older. The pre-retirement age (45–64) share of the population has increased to 25.5 percent in the year ending March 2020 from 18.9 percent in 1989.

Mapping American Community Survey data to commuter zones gives insight on the age of the population in local labor markets. In 2018, among commuter zones with a population of at least 100,000, the commuter zone (listed by largest city) with the highest share of its population under 18 is Provo, UT (33.1 percent), followed by Laredo, TX (32.6 percent), and Brownsville, TX (31.6 percent). The commuter zones with lowest share of the local population under 18 were Sarasota, FL (15.6 percent), Ocala, FL (16.7 percent), and State College, PA (17.1 percent).

The age 65 or older population is disproportionately concentrated in Florida. The commuter zone with the highest share of its population over 64 is Sarasota, FL (33.4 percent), followed by Ocala, FL (32.8 percent), and Cape Coral, FL (29.9 percent). The commuter zones with lowest local over-64 population share were Provo, UT (8.3 percent), Laredo, TX (9.7 percent), and Odessa, TX (10.4 percent).

Age Group Share of Commuter Zone Population, 2018

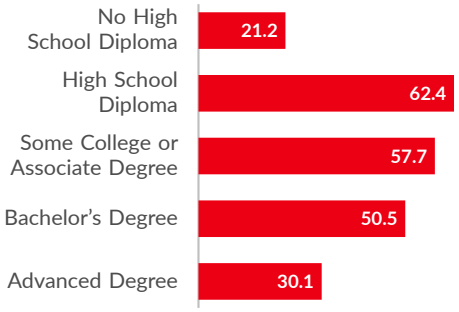
Education

Education is central in many discussions of the future of the US economy. Though very expensive in forgone years of earnings and often also expensive in tuition and textbooks costs, education typically results in higher earnings. In response to changing job opportunities from globalization and other policy decisions, household spending on education has increased considerably, resulting in a much **more educated population**.

Over the year ending March 2020, 80.5 million people over the age of 25, or 36.3 percent of the total, have at least a bachelor's degree, with 30.1 million of those, or 13.6 percent of the total, holding an advanced degree such as a master's degree, medical or law degree, or PhD. An additional 57.7 million people have some college coursework but no degree or have an associate degree. A total of 62.4 million have a high school diploma but no college, while 21.2 million have no high school diploma.

Highest Level of Education
age 25+ population, in millions, March 2020



Source: Author's Calculations from CPS

The share of the population with a bachelor's degree or advanced degree increased by 10.4 percentage points since 2000. The increase is even more pronounced among those who are employed; 42.0 percent have a college degree or advanced degree in March 2020, an increase of 11.0 percentage points since 2000. One argument is that households were compensating for a weak labor market and lack of bargaining power by borrowing large sums of money for education. However, given the extent of the increase in education, and the typical wage premium of education, labor income should have increased much more than it actually did.

Income to Persons

This section looks at **income received by people**, by type of income, adjusted for inflation using the PCE implicit price deflator. Income is divided into labor income (see), which is measured as compensation of employees, capital income (see), measured as the sum of proprietor income, rental income, and dividend and interest income, and welfare income (see), which is measured as transfers to persons, primarily government social benefits, less contributions to social insurance.

In March 2020, annualized personal income is equivalent to $56,718 per person. Labor income totals $34,463 per person; capital and proprietor income is $16,478 per person; and welfare or transfer income is $5,777 per person.

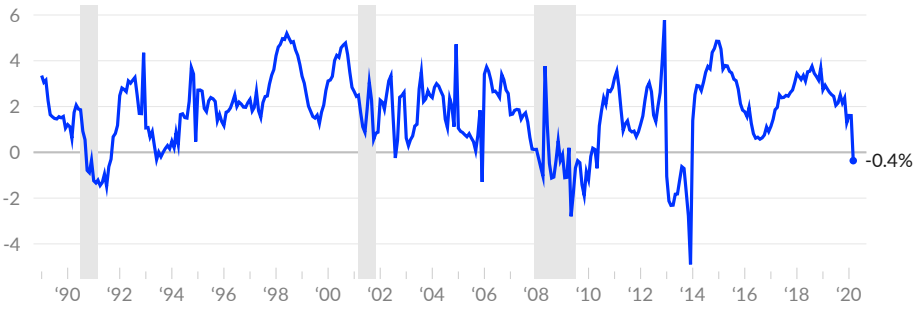
The Bureau of Economic Analysis reports an inflation-adjusted one-year change in after-tax income per person (see —) of -0.4 percent in March 2020, 1.6 percent in February 2020, and 2.8 percent in March 2019. Over the past year, the measure has averaged 2.0 percent.

After-Tax Income Growth

annual growth, per capita real disposable personal income, percent



Source: Bureau of Economic Analysis

Earnings, which include wages and salaries as well as self-employment income, comprise the majority of personal income. Yet only 52 percent of people have any earnings in 2018 (see ■). Only 43 percent of people have earnings above the single-person poverty threshold of $12,800.

Total income, including taxes, welfare, and capital income, reaches 71 percent of people (see ■). The remainder live with people with income or receive private transfers. Values of high-earners are not show because of space constraints. The top one percent income threshold is around $420,000.

Distribution of Personal Income, 2018

thousands of US Dollars, by percentile

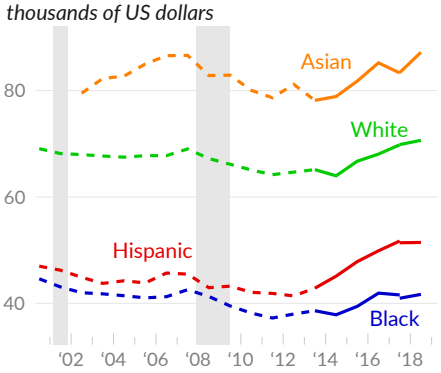
Household Income

Given the massive variance in personal income, with half of the population receiving no market income, the sharing of income between people is key to survival. Household income measures the combined income of all people in a given housing unit. Even among individuals who receive market income, this income is distributed very unevenly. Likewise, the share of the household that receives income varies between households. As a result, differences in income between individual households are still massive.

Real Median Household Income
thousands of US dollars



Source: Economic Policy Institute, Census

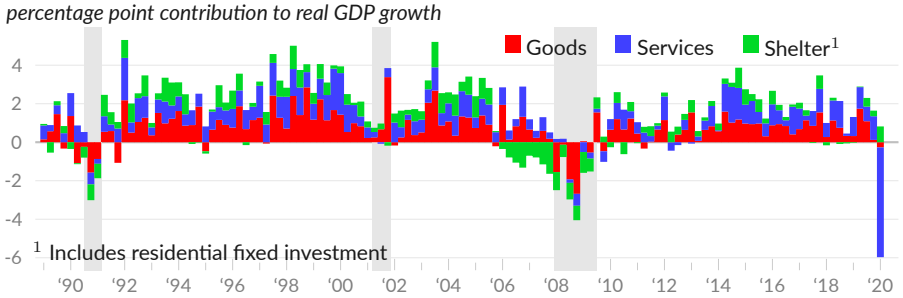
Black median household income in 2018 was $41,692, compared to an inflation adjusted equivalent of $40,963 in 2017. White, non-Hispanic median household income was $70,462 compared to $69,851 in 2017. Hispanic median household income in 2018 was $51,450 compared to $51,390 in 2017. Asian median household income was $87,194 in 2018 and $83,376 in 2017. Data for 2000–2013, shown with dashed lines, are calculated by EPI, to be more-comparable over time despite changes to the survey design in 2013 and to the processing of survey data in 2017.

Household Expenditures

This section covers household spending on goods (see ■), services excluding housing and utilities (see ■), and shelter (see ■ , calculated as housing services and utilities combined with residential fixed investment). These categories subtracted 5.89 percentage points from GDP growth in 2020 Q1, far below the average contribution of 1.26 percentage points over the past three years.

Consumer Spending and Residential Investment

percentage point contribution to real GDP growth



Source: Bureau of Economic Analysis

In the the first quarter of 2020, household spending on goods subtracted 0.27 percentage point from GDP growth, household spending on services other than housing and utilities subtracted 5.70 percentage points, and shelter spending and investment contributed 0.82 percentage point. Spending on health care services subtracted 2.25 percentage points from GDP growth in 2020 Q1 and has contributed 0.12 percentage point, on average, over the past three years.

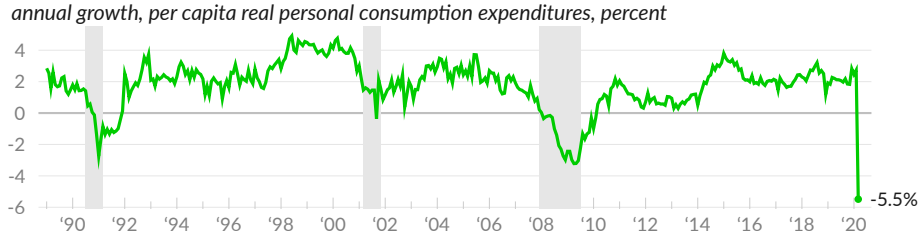
Consumer spending is also reported on a monthly basis. Inflation- and population-adjusted consumer spending increased by -5.5 percent over the year ending March 2020 (see —), compared to an equivalent increase of 2.3 percent for the year ending March 2019.

Consumer Spending Growth

annual growth, per capita real personal consumption expenditures, percent



Source: Bureau of Economic Analysis

Changes to consumer spending (see —) are largely the result of changes to income (see ■) and changes to the rate at which income is saved (see ■). Changes to other outlays (see ■) reflect changes in interest payments, fines and fees, and charitable giving.

Real per capita consumer spending was unchanged over the four quarters ending 2020 Q1. Changes to disposable income added 1.1 percentage points, changes to saving subtracted 1.2 percentage points, and changes to other outlays added 0.1 percentage points. Over the past three years, real per capita consumer spending growth has averaged 1.4 percent, with income growth contribuing an average of 2.6 percentage points and saving subtracting an average of 1.1 percentage points.

Contributions to Consumer Spending

Source: Bureau of Economic Analysis

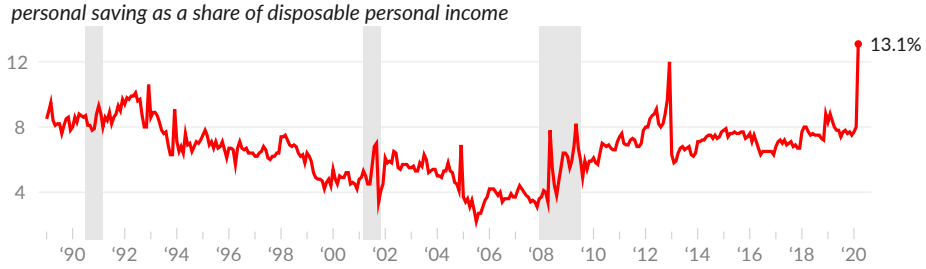
Saving

The portion of after-tax income that is not spent by households is considered **personal saving**, from an economic accounting perspective. Personal saving as a share of disposable personal income is referred to as the *personal saving rate*. Households use savings to handle unexpected expenses or cover expenses when income falls. However, economists also point out that aggregate personal saving is a direct reduction in corporate profits, as it represents income to persons that was at some point a business expense, but that does not get returned to businesses as revenue through consumer spending.

As of March 2020, the Bureau of Economic Analysis reports a rate of personal saving of 13.1 percent (see —). Over the past three years, the personal saving rate increased by a total of 5.9 percentage points.

Personal Saving Rate

personal saving as a share of disposable personal income



Source: Bureau of Economic Analysis

Consumer Sentiment

The University of Michigan conducts a regular monthly survey used to gauge individuals' **consumer sentiment** (see —). The measure is based on questions related to personal finances, business conditions, and buying conditions. An increase in consumer sentiment means individuals feel more confident about economic conditions and are more willing to make large purchases or take on debt. As of April 2020, the latest value of the consumer sentiment index is 71.8, compared to 89.1 in March 2020 and 97.2 in April 2019.

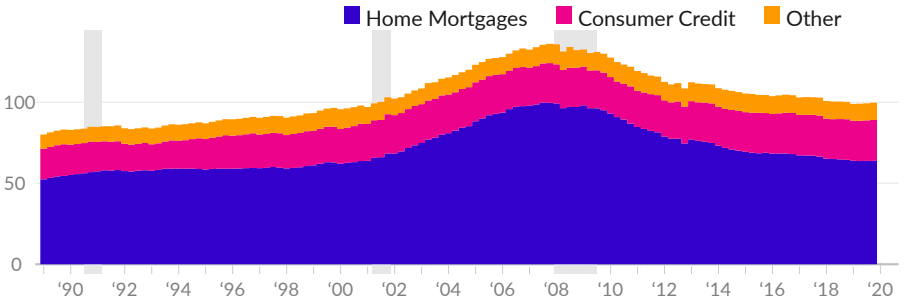
Household Balance Sheets

Liabilities

The Federal Reserve reports total liabilities of households and nonprofits of $16.58 trillion in 2019 Q4. The vast majority–$10.61 trillion or 64.0 percent of the total–are home mortgages (see ■). Consumer credit liabilities (see ■) which include auto loans, credit card debt, student loans, and other personal loans, total $4.19 trillion (25.3% of the total). The remaining liabilities (see ■) are primarily attributable to nonprofits.

The ratio of household and nonprofit debt to disposable personal income has fallen to 99.7 percent in 2019 Q4 from its housing-bubble peak of 136.0 percent in 2007 Q4. Over the past three years, nominal household and nonprofit debt has increased 10.7 percent while nominal disposable personal income has increased 14.4 percent. As a result, the ratio of household and nonprofit debt to disposable personal income has fallen by 4.6 percentage points.

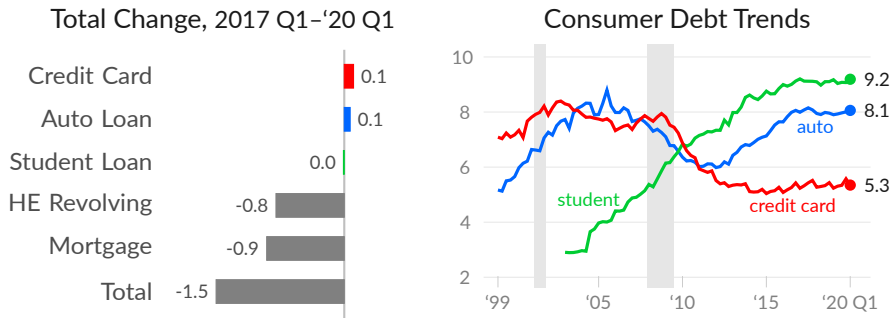
Household and Nonprofit Debt
by type, as share of disposable personal income



Source: Federal Reserve and Bureau of Economic Analysis

Federal Reserve Bank of New York (FRBNY) analysis of Equifax data shows $14.3 trillion in total consumer debt in 2020 Q1, which is equivalent to 85.6 percent of disposable personal income. Over the past three years, total consumer debt has increased by $1.58 trillion compared to an increase of $2.10 trillion in disposable personal income. As a result, the ratio of total consumer debt to disposable personal income has fallen by 1.5 percentage points over this period.

Mortgages and Consumer Credit
share of disposable personal income, percent



Source: Federal Reserve Bank of New York and Bureau of Economic Analysis

Trends in **household debt** over the past three years, measured in both the US Financial Accounts and the New York Fed Consumer Credit Panel, show consumer credit growing in line with income while mortgage debt falls relative to income. Minor discrepancies between the two data sources arise because the Financial Accounts include debt of nonprofit institutions and the Consumer Credit Panel does not include persons without a social security number.

According to the same FRBNY data, mortgage debt, including home equity lines of credit, totalled $10,099 billion in 2020 Q1, equivalent to 60.5 percent of disposable personal income (DPI). Student loans totalled $1,535 billion, or 9.2 percent of DPI; auto loans totalled $1,346 billion (8.1 percent of DPI); and credit card debt totalled $893 billion (5.3 percent of DPI).

Over the past three years, the ratio of total mortgage debt to disposable personal income fell by 1.7 percentage points, compared to virtually no change for student loans, an increase of 0.1 percentage points for auto loans, and an increase of 0.1 percentage points for credit card debt

Financial Obligations

Payments to service debt, along with rent, auto lease payments, homeowner's insurance, and property tax are considered financial obligations. The Federal Reserve reports financial obligations as a share of disposable personal income. As of 2019 Q4 the financial obligations ratio is 15.1 percent. (see —). The measure peaked at 18.1 percent in 2007 Q4, during the housing bubble.

Financial Obligation Ratio

share of disposable personal income, percent

Assets

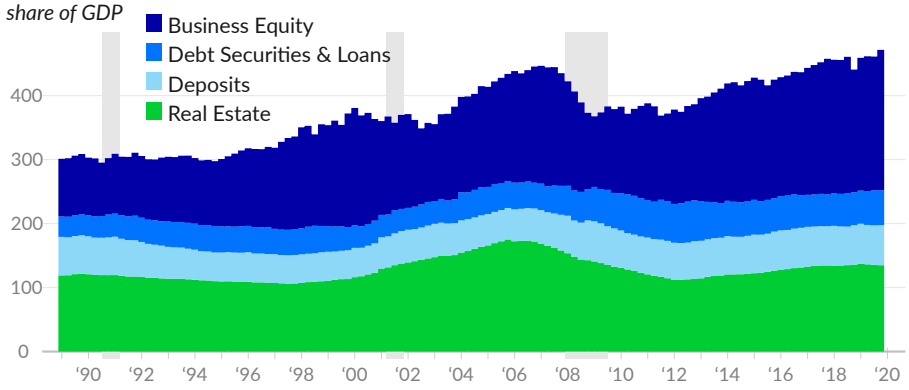
Assets of households and nonprofits were valued at $134.9 trillion in 2019 Q4, equivalent to 621 percent–or 6.21 years–of GDP. Of this, $39.3 trillion, or 29.1 percent of the total, are tangible assets and $95.6 trillion, or 70.9 percent, are financial assets.

Tangible, or non-financial, assets include peoples' homes as well as consumer durable goods, such as cars, furniture, and appliances. The market value of owner-occupied real estate is $29.3 trillion in 2019 Q4, equivalent to 1.35 years of GDP (see ■). Consumer durable goods have a replacement value of $5.8 trillion, or 0.26 years of GDP. Tangible assets are reported for the combined household and nonprofit sector and include real estate and equipment belonging to nonprofits, which totals $4.3 trillion in 2019 Q4.

Financial assets include equity in businesses–corporate and non-coporate–with a market value of $47.7 trillion, or 2.2 years of GDP (see ■), in 2019 Q4. Debt securities and loan assets total $11.8 trillion, or 0.54 years of GDP (see ■). Cash and deposits, including money market accounts, total $13.6 trillion, or 0.63 years of GDP (see ■). All other financial assets total $22.5 trillion.

Selected Household and Nonprofit Assets

share of GDP



Source: Federal Reserve, Bureau of Economic Analysis

Household and nonprofit assets grew by 8.0 percent over the year ending 2019 Q4. Owner-occupied real estate contributed 0.4 percentage points to total growth, and business equity contributed 5.7 percentage points.

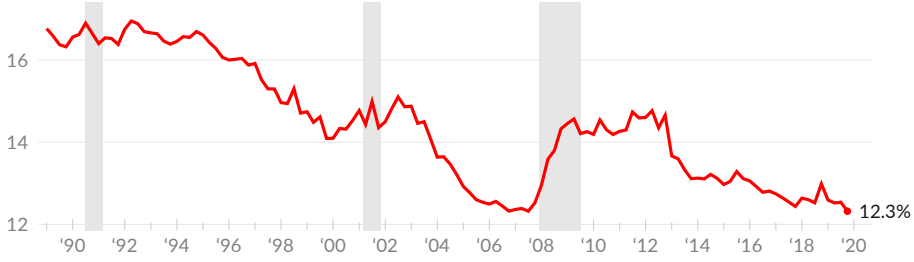
Return on Assets

The increase in assets as a share of GDP also means that the return on total household assets has fallen, as measured by disposable income as a share of household assets. As of 2019 Q4, disposable income was equivalent to 12.3 percent of total assets (see —), compared to an average rate of 16.0 percent during the 1990s.

Return on Household Assets

disposable personal income as share of household and nonprofit total assets, percent



Source: Federal Reserve, Bureau of Economic Analysis

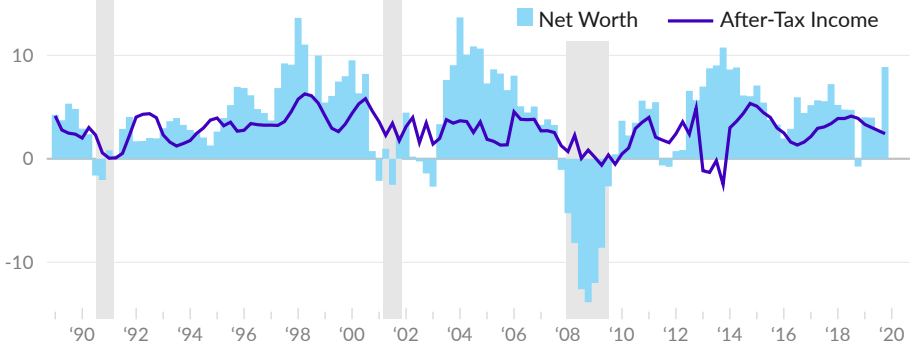
Net Worth

The market value of assets of households has risen much faster than their total liabilities, causing a **substantial increase in net worth**. Net worth is an aggregate measure of the financial position of households, measured as total assets minus total liabilities. In 2019 Q4, household and nonprofit institution net worth was $118.4 trillion, equivalent to 7.1 years of disposable personal income; the result of total assets of $134.9 trillion and total liabilities of $16.6 trillion.

In 2019 Q4, inflation-adjusted net worth increased by 8.9 percent (see), and inflation adjusted after-tax income increased by 2.4 percent (see —). Over the past three years, real net worth grew at an average rate of 4.7 percent, while real after-tax income grew at an average rate of 3.1 percent

Net Worth and After-Tax Income Growth

one-year percent change in net worth and after-tax income, adjusted by PCE price deflator

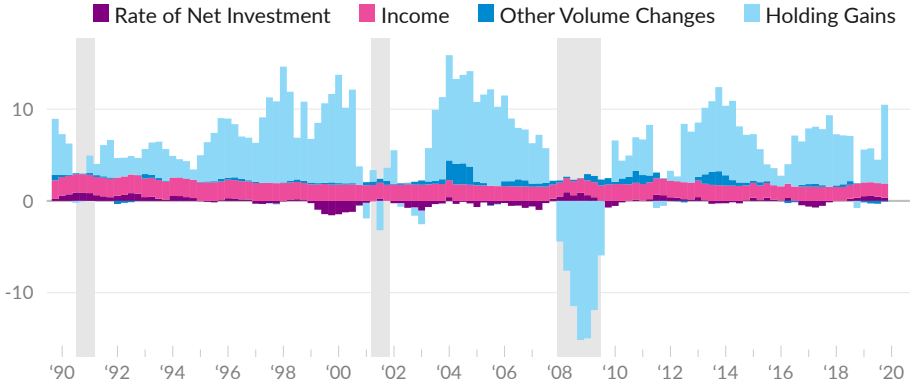


Source: Federal Reserve, Bureau of Economic Analysis

Changes in net worth come from the revaluation of assets and from net investment of income. Changes to the value of assets, for example capital gains from an increase in the market value of corporate equities, explain most of the changes in net worth (see). Each period households also receive income and decide investment, saving, and borrowing. Net investment equals capital expenditures less depreciation plus net lending/borrowing; positive net investment results in an increase in net worth. Since 1989, household net investment has averaged 10 percent of disposable personal income. Income that goes to net investment at this historical-average rate (see) can be separated from periods where the rate of net investment is above or below this historical average (see). This distinction can identify how changes in disposable personal income, and changes in decisions about how to use that income, combine to affect net worth. Changes in data sources or from natural disasters are also identified as other volume changes (see).

Net Worth Growth

contribution to one-year percent change in net worth, nominal



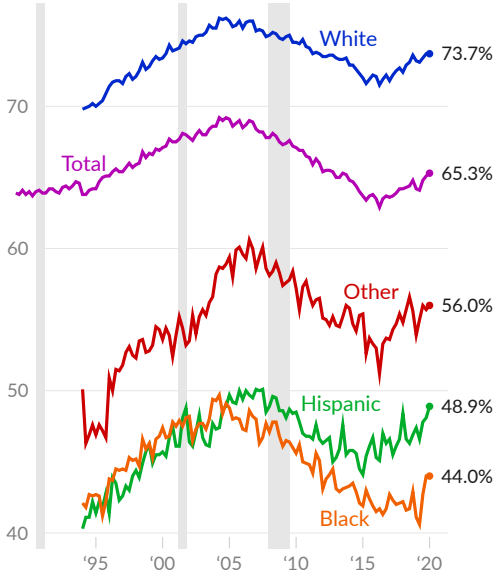
Source: Federal Reserve, Bureau of Economic Analysis

In the the fourth quarter of 2019, holding gains contributed 8.6 percentage points to the 10.4 percent change in net worth. Income invested at the 1989-onward average rate of 10.1 percent would have contributed 1.5 percentage points; an additional 0.4 percentage points were added as household net investment was 12.4 percent of disposable person income in 2019 Q4. Other volume changes did not contribute significantly. Over the past three years, nominal one-year growth of net worth averaged 6.6 percent. Holding gains contributed 4.9 percentage points on average; net investment of income contributed 1.9 percentage points; and other volume changes did not contribute significantly.

Homeownership

The **homeownership rate** measures the percent of housing units that are owner-occupied, as opposed to rented. In 2004, near to the peak of the housing bubble, the overall homeownership rate reached 69.2 percent. As of 2020 Q1, the Census Bureau reports a rate of home-ownership of 65.3 percent (see —). Over the past three years, the overall US homeownership rate increased by a total of 1.7 percentage points.

Homeownership Rate
share of households occupied by owners, percent



Source: Census Bureau

Census data also show large differences in homeownership rates by race and ethnicity. Around three-quarters (73.7 percent in 2020 Q1) of non-Hispanic white households own their home (see —), compared to fewer than half of black and Hispanic households.

During the housing bubble, the homeownership rate for black households increased by nearly ten percentage points, peaked at 49.7 percent in the second quarter of 2004, and fell to 40.6 percent in 2019 Q2. The current homeownership rate for black households is 44.0 percent, as of 2020 Q1 (see —). The homeownership rate for Hispanic households of any race is 48.9 percent in 2020 Q1, substantially below the 50.1 percent peak rate in the first quarter of 2007 (see —).

As seen during the collapse of the housing bubble, it is possible for someone to be a homeowner but have no equity in their home, for example if the market price of the home falls below the principal remaining on the mortgage. Trends in owner's equity as a share of the market value of real estate show substantial improvement since the lows following the collapse of the housing bubble, when millions of homes were in foreclosure.

As of 2019 Q4, the Federal Reserve reports owners' equity is 63.8 percent of residential real estate (see —). Over the past three years, the owners' equity share increased by a total of 2.9 percentage points. Over the past year, the share increased by a total of 0.2 percentage points. The current share is substantially below the 1989 average of 67.9 percent.

Source: Federal Reserve and Census Bureau

The Census Bureau tracks the issuance of new residential building permits, which offer insight into planned residential construction. In March 2020, a seasonally-adjusted annual rate of 1,353,000 new residential housing units were authorized by building permits, the lowest level since July 2019 (see —). Permits issued decreased by 99,000 (-6.8 percent) over the previous month, increased by 65,000 (5.0 percent) over last March, and increased by 282,000 (26.3 percent) total over the past five years.

Residential Construction

building permits issued, in thousands

The Federal Housing Finance Agency (FHFA) housing price index (see —) increased by 5.7 percent over the year ending February 2020. Among Census Divisions, the fastest one-year housing price index growth rate in February 2020 was 8.1 percent in the Mountain Division, which includes Arizona, Colorado, Idaho, Montana, New Mexico, Nevada, Utah, and Wyoming

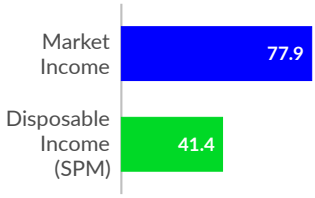
Poverty

In 2018, income from labor and capital ownership, called *market income*, was below the Census Bureau threshold for poverty for 77.9 million people in the US. Disposable income subtracts taxes and includes market income plus income from government programs and tax credits. According to the Census Bureau Supplemental Poverty Measure (SPM), **41.4 million people are in poverty** after taxes and transfers. Government programs and tax credits moved the income of 36.5 million people above the poverty threshold.

In Poverty, 2018
millions of people

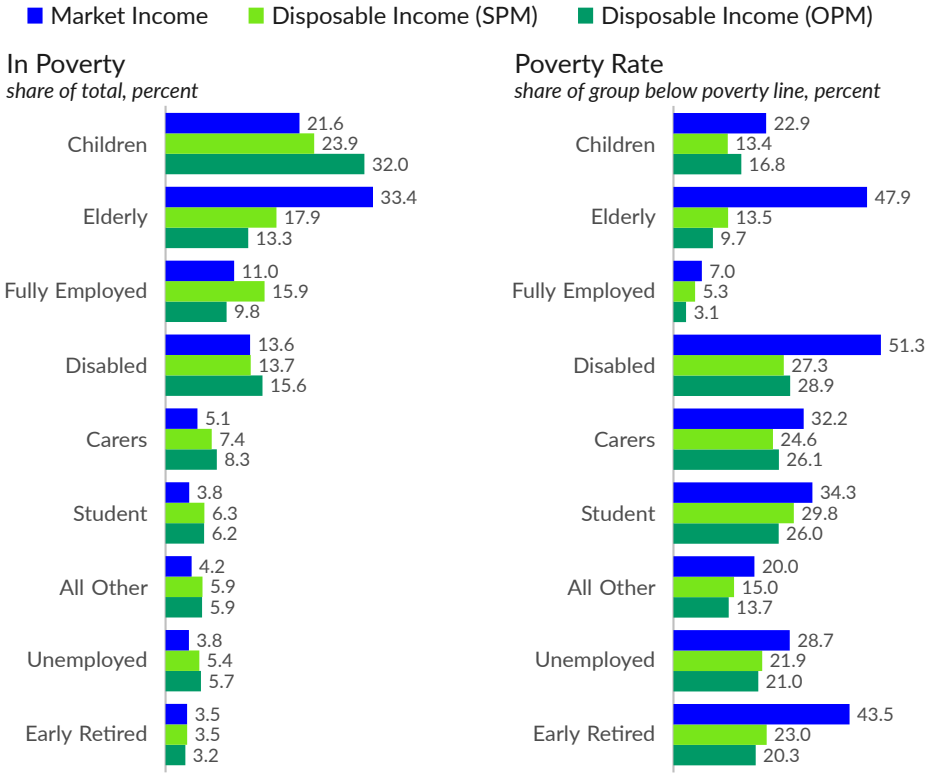


Source: CPS ASEC

For purposes of program eligibility and economic data, poverty is defined by having income below a certain threshold. The processes for calculating poverty vary, with the Official Poverty Measure (OPM) based on three times a price-adjusted 1963 minimal food budget, and the SPM based on food, shelter, clothing, and utilities costs and additionally capturing program benefits and taxes, along with other adjustments.

While some fully-employed people are in poverty, **the vast majority of poor people are children, elderly, disabled, caregivers, and students**. These groups represent 69.2 percent of those in poverty in 2018. If the missing labor income required to keep a person out of poverty is not supplied in the form of capital income or welfare income, the person will be poverty, by definition. As a result, these groups that are disproportionately work-limited in some way have much higher rates of poverty.

Poverty Measures, 2018



Source: CPS ASEC; Author's Replication of Bruenig, see

The share of a group whose combined labor, capital, and welfare income is below the poverty line is the poverty rate for the group. In 2018, students, caregivers, and the disabled had the highest rates of poverty. Those fully-employed have a very low rate of poverty. The elderly also have a much lower poverty rate as the result of Social Security.

By age, market income (see ■) leaves the elderly particularly vulnerable to poverty, as they are not as likely to have labor income. After social benefits and taxes (disposable income [see ■]), the elderly have much lower rates of poverty than other age cohorts. Higher survivorship for the wealthy also has the effect of reducing poverty in very old ages. Disposable income still leaves young adults and those just below social security and medicare age (late 50s and early 60s) vulnerable to poverty, relative to other ages.

Amount of Poverty by Age ■ Market Income ■ Disposable Income (SPM)
in billions of 2018 US Dollars

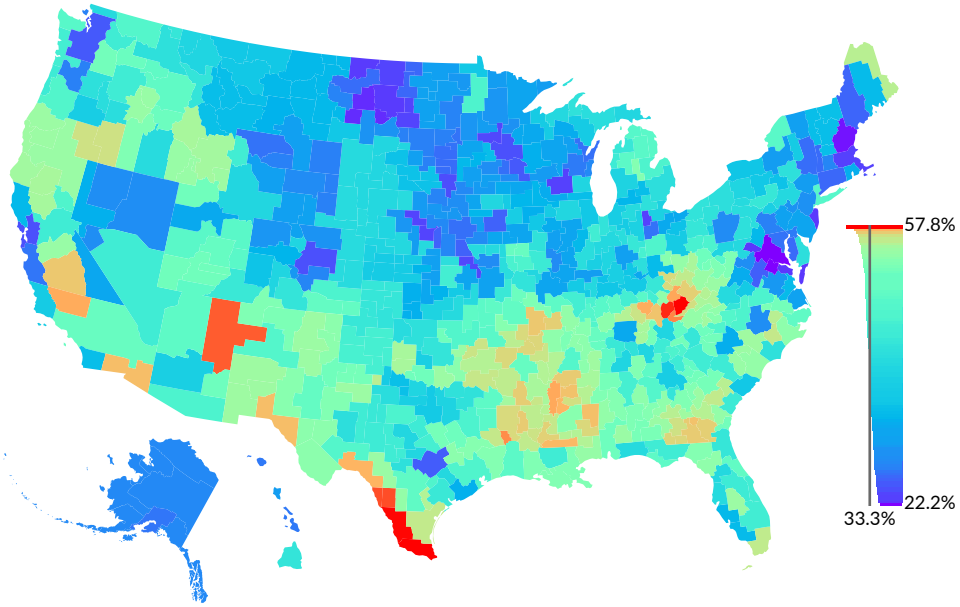
Share of local population in bottom third of housing-adjusted income, 2018
Share of commuting zone householders with after-housing-expense annual income below $13,573



Source: American Community Survey

The Census Bureau reports the number of people taken out of poverty by various government programs, along with how many people are put in poverty by various expenses. In 2018, Social Security lifted income above the poverty line for 27.2 million people, by far the most effective program for reducing poverty. Refundable tax credits, such as the earned income tax credit and child tax credit, lifted nine million people out of poverty. These tax credits are phased-in (not fully-refundable), meaning they do not reach the poorest of poor people. As a result, phased-in tax credits have more impact on the poverty headcount than on poverty, relative to programs designed to help the poorest of the poor.

In terms of elements that add to the number of people in poverty, medical expenses are the most significant, and cause the disposable income of eight million people to fall below the poverty line. Work expenses additionally put 5.7 million people in poverty.

Effect of Individual Elements on Poverty Headcount

Businesses

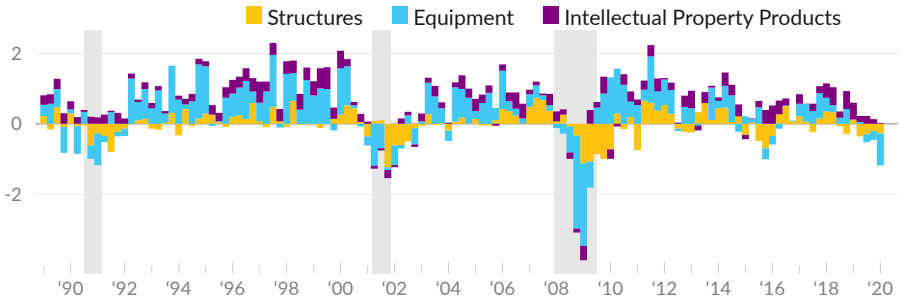
The factories, offices, and equipment that workers use to produce goods and services are all important to the economy. This section looks at the loosely defined business sector, with data covering business investment, retail sales, industrial production, corporate profits, and the financial activities of businesses.

Fixed Investment

When businesses purchase items with a useful life of more than one year it is considered an investment, an exchange of assets rather than an expense. **Investments in fixed assets make workers more productive**, as they allow businesses to produce goods and services per hour of work. Business investments in fixed assets are grouped broadly as structures (see), equipment (see), and intellectual property products (see).

Business Fixed Investment

percentage point contribution to real GDP growth



Source: Bureau of Economic Analysis

Business investment subtracted 1.17 percentage points from GDP growth in 2020 Q1, substantially below the average contribution of 0.35 percentage point over the past three years. In 2020 Q1, investment in structures subtracted 0.28 percentage point from GDP growth, investment in equipment subtracted 0.91 percentage point, and investment in intellectual property products contributed 0.02 percentage point.

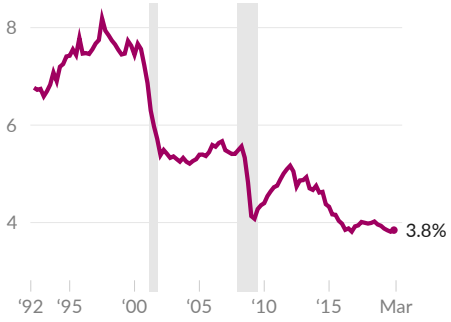
Productive business investments also show up as **new orders for core capital goods**. The category excludes the more-volatile aircraft orders as well as defense-related orders, and is derived from a Census Bureau survey of shipments, inventories, and orders.

New orders for manufactured core capital goods excluding aircraft totalled $69 billion in March 2020, equivalent to 3.8 percent of GDP (see —). New orders decreased by 0.7 percent over the past year.

New Orders for Core Capital Goods

nondefense capital goods ex-aircraft, share of GDP



Source: Census Bureau

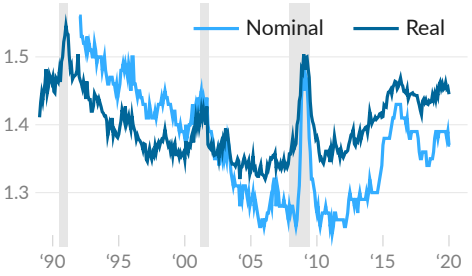
Inventories

Changes in private inventories are often grouped with investment in national accounts. For purposes of flow measures such as GDP, inventory changes capture a situation where goods were produced but not sold and therefore are not included in consumption or investment. This situation can allow a drop in spending that was not predicted to be obscured in GDP growth figures. However, BEA reports an inflation adjusted indicator of the ratio of inventories to sales in manufacturing and trade businesses (see —) as part of the underlying details tables.

When thinking about the longer-term trends in these data, it's important to note that sales of businesses include services while inventories include only goods. Over the past 30 years, sales have shifted towards services, which reduces the inventories to sales ratio, all else equal.

Inventories to Sales Ratio

total business



Source: FRED, BEA

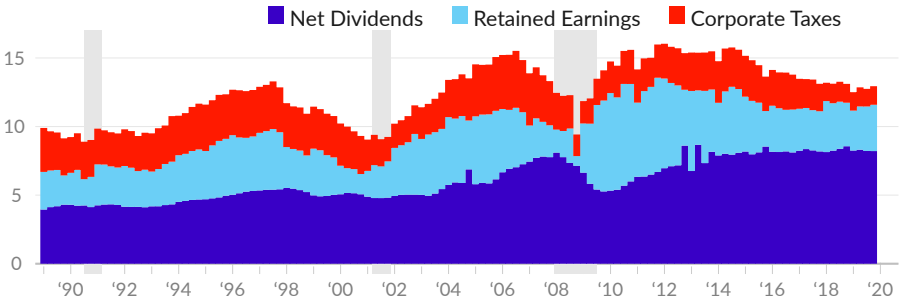
Census reports the nominal ratio of inventories to sales for the total business sector (see —). In February 2020, the ratio of inventories to sales was 1.37, compared to 1.37 in January 2020, and 1.39 in February 2019. The inflation adjusted version from BEA shows inventories at 1.45 times sales in January 2020, compared to 1.46 in January 2019. From 2011 to 2014, real monthly inventories were 1.38 times real monthly sales, on average.

Corporate Profits

The national accounts include detailed information on **aggregate corporate profits**, which are an important determinant in the business cycle. In the fourth quarter of 2019, aggregate corporate profits were $2.13 trillion, or 12.9 percent of net national income. Of this, $1.35 trillion, equivalent to 8.2 percent of net national product, were paid out as dividends (see ■), $556 billion were retained (see ■), and $223 billion went to corporate income tax (see ■).

Destination of Corporate Profits

share of net national income



Source: Bureau of Economic Analysis

Aggregate corporate savings (corporate profits less dividends and corporate profit tax) are the result of net investment and non-business saving. Investment (see ■) is a source of aggregate profit because it is revenue for one party but not an expense for the other. Non-business saving, which includes household (see ■), government (see ■), and rest of world saving (see ■), necessarily reduces aggregate corporate profits because it is money that did not return to businesses as revenue.

Sources of Corporate Saving

contribution to corporate saving, as share of gross national income

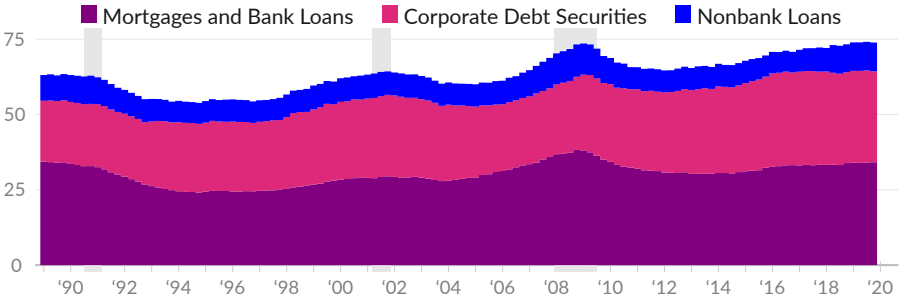
Business Debt

As of 2019 Q4, nonfinancial business debt–the debt security and loan liabilities of nonfinancial businesses–both corporate and non-corporate–totals $16,058 billion, with $10,117 billion (63.0%) held by corporate businesses. Over the past three years, nonfinancial business debt has increased faster than overall economic activity. As a share of GDP, nonfinancial business debt increased by 3.1 percentage points to 73.9 percent in 2019 Q4 from 70.8 percent in 2016 Q4. The vast majority of the increase, 2.7 percentage points, comes from nonbank loans (see ■).

Nonfinancial Business Debt

by type, as share of GDP



Source: Federal Reserve and Bureau of Economic Analysis

The debt of the domestic financial sector includes agency and government-sponsored enterprise (GSE) backed securities (see ■), corporate and foreign bonds, loans (see ■), and open market paper. The long-term increase in financial sector debt reflects the emergence and growth of various asset-backed securities. In addition to home mortgage-backed securities, the domestic financial sector issues debt securities based on commercial mortgages, auto loans, credit card, student debt, and even restaurant revenue.

Domestic financial sector debt has fallen as a share of GDP to 76.9 percent in 2019 Q4 from a housing-bubble peak of 124.3 percent in 2009 Q1.

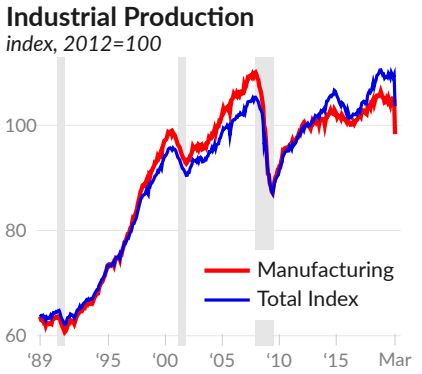
Industrial Production

A monthly index produced by the Federal Reserve shows industrial production decreased by 5.5 percent over the year ending March 2020, following virtually no change over the year ending February 2020. One-year growth in manufacturing production was -6.6 percent in March 2020, and manufacturing subtracted 4.9 percentage points from the overall change in industrial production. Over the same period, mining did not contribute to the overall change, and electric and gas utilities subtracted 0.5 percentage point.

By market group, production of consumer goods subtracted 1.7 percentage points from one-year industrial production growth in March 2020. Production of business equipment subtracted 1.2 percentage points, production of nonindustrial supplies subtracted 0.7 percentage point, and production of materials subtracted 1.7 percentage points.



Source: Federal Reserve

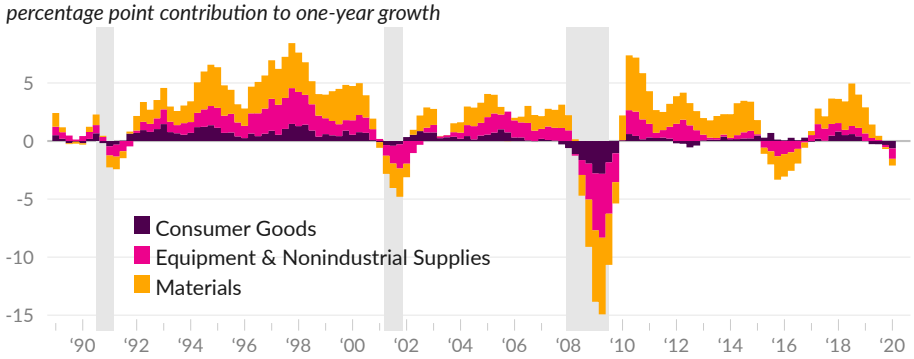
Market group data show the lack of growth in the production of consumer goods, equipment, and nonindustrial supplies over the past decade.

Industrial Production Growth, Market Group

percentage point contribution to one-year growth

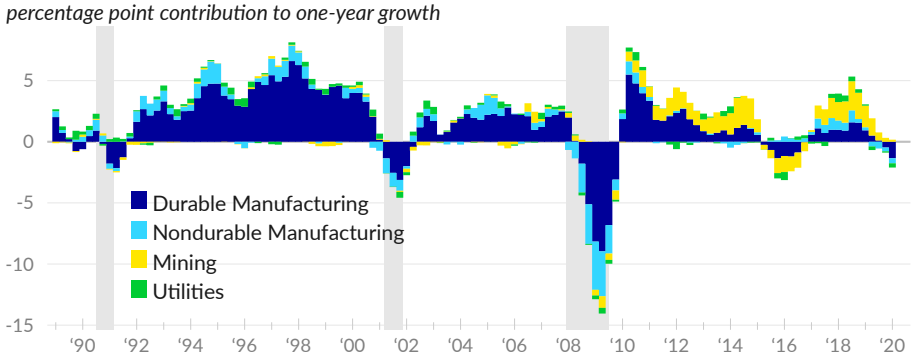


Source: Federal Reserve

Industry group data show a change in the composition of new industrial activity, towards mining and away from manufacturing.

Industrial Production Growth, Industry Group

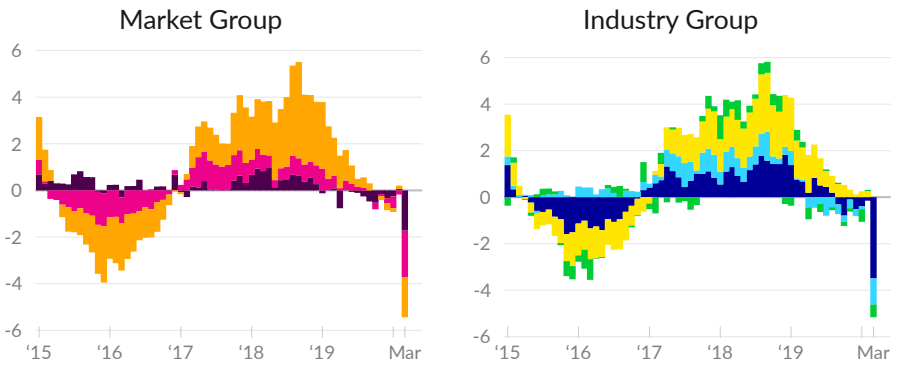
percentage point contribution to one-year growth



Source: Federal Reserve

The recent slowdown has been broad-based. The monthly data are shown in detail below.

Recent data in detail

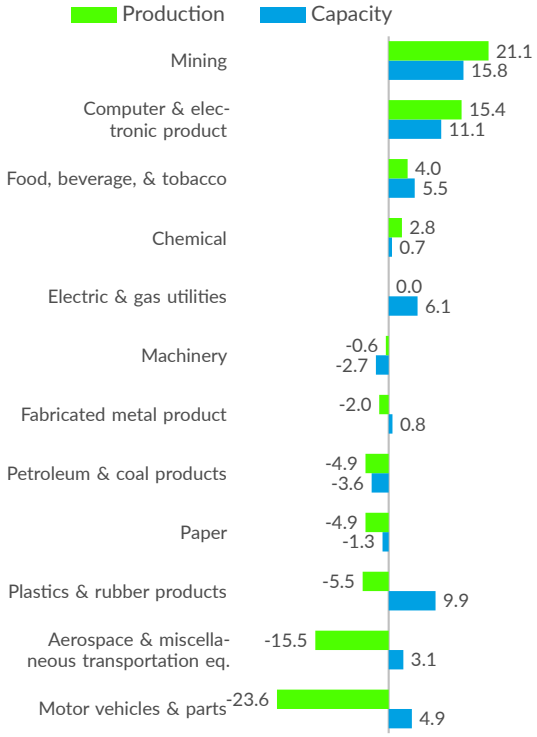


Source: Federal Reserve

Of a subset of 12 industries that contribute the majority of industrial production, four increased **production** over the past three years, seven decreased production, and one was unchanged (see ■). Over the three years ending March 2020, motor vehicles & parts production decreased by 23.6 percent, mining production increased by 21.1 percent, aerospace & miscellaneous transportation equipment production decreased by 15.5 percent, and production of computer & electronic products increased by 15.4 percent.

Over the three years ending March 2020, nine of the 12 industries increased **capacity**, three decreased capacity, and none were unchanged (see ■). Over the three-year period, mining capacity increased by 15.8 percent, production capacity for computer & electronic products increased by 11.1 percent, and production capacity for plastics & rubber products increased by 9.9 percent.

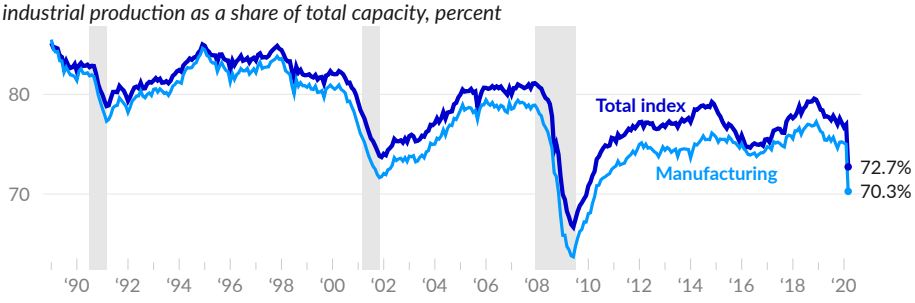
Industrial Production and Capacity
total three-year growth, percent, March 2020



Source: Federal Reserve

The Federal Reserve's monthly industrial production report also measures the economy's total industrial capacity. The extent to which the economy is using its industrial capacity is called **capacity utilization**, and calculated as industrial production as a share of total industrial capacity. Long-term, capacity utilization has fallen as many US factories and industrial production facilities closed. In March 2020, the industrial capacity utilization rate was 72.7 percent (see —), and the manufacturing capacity utilization rate was 70.3 percent (see —). Total capacity utilization has fallen by 12.4 percentage points since January 1989.

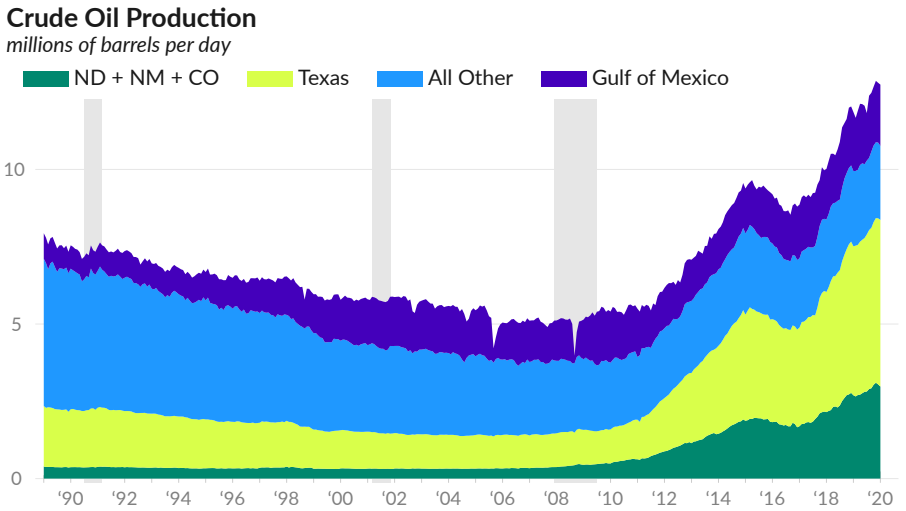
Capacity Utilization
industrial production as a share of total capacity, percent



Source: Census Bureau

Energy Production and Use

The Energy Information Administration reports that US has seen a massive increase in **crude oil production** over the past six years. The infrastructure for much of this production was put in place when oil prices were higher, and the profitability of the sector depends on oil maintaining a certain price. A large portion of the increase in oil production comes from New Mexico, South Dakota, and Colorado.



Source: Energy Information Administration

Retail Sales

According to the Census Bureau, retail and food service sales totalled $483.1 billion in March 2020, equivalent to roughly 26.7 percent of GDP on an annualized basis. Over the past year, retail and food service sales decreased by 6.2 percent, without adjusting for prices (see —). Nonstore sales, which include online retailers, have increased by 9.7 percent over the same period (see —), and total $68.8 billion, or roughly 3.8 percent of GDP.

Government

Public institutions are collectively referred to as the *public-sector* or the *government*. In the United States, the government has the authority to spend, tax, and create money, as well as to regulate economic and financial activity. The government also enforces and determines the ownership of property. These activities are all extremely important to production and distribution in the economy.

Government Spending and Investment

Government consumption expeditures and gross investment, which provide services and infrastructure, contributed 0.13 percentage point to real GDP growth in 2020 Q1, substantially below the average contribution of 0.42 percentage point over the past year, and slightly below the average of 0.24 percentage point since 1989. In 2020 Q1, federal defense spending and investment (see ■) contributed 0.03 percentage point, nondefense federal government spending and investment (see ■) contributed 0.08 percentage point, and state and local government (see ■) contributed 0.02 percentage point.

Government current expenditures include consumption and investment as well as transfers such as government social benefits to persons. Government spending provides services and income to people. Government current receipts, mostly tax receipts, remove demand from the economy. When government expenditures exceed receipts, it is referred to as a *government deficit*, and corresponds to a private sector surplus. The size of the government deficit relative to GDP gives insight into the extent to which the government is stimulating the economy by increasing household income and corporate profits.

In 2019 Q4, federal government expenditures total $4.9 trillion, equivalent to 22.4 percent of GDP, and receipts total $3.6 trillion, or 16.8 percent of GDP. The federal deficit was therefore $1.2 trillion or 5.7 percent of GDP. Over the past three years, the ratio of expenditures to GDP increased by a total of 0.4 percentage point, and the ratio of receipts to GDP has decreased by a total of 1.6 percentage points, causing the deficit to widen by 2.0 percent of GDP.

Consolidated state and local government expenditures total $3.0 trillion, or 13.8 percent of GDP, in 2019 Q4, and receipts total $2.8 trillion, equivalent to 12.7 percent of GDP. The combined state and local government deficit was $232 billion or 1.07 percent of GDP. Over the past three years, the expenditures to GDP ratio decreased by a total of 0.57 percentage point at the consolidated state and local level, and the ratio of receipts to GDP has decreased by a total of 0.38 percentage point, causing the deficit to shrink by 0.19 percent of GDP.

Receipts and Expenditures as Share of GDP

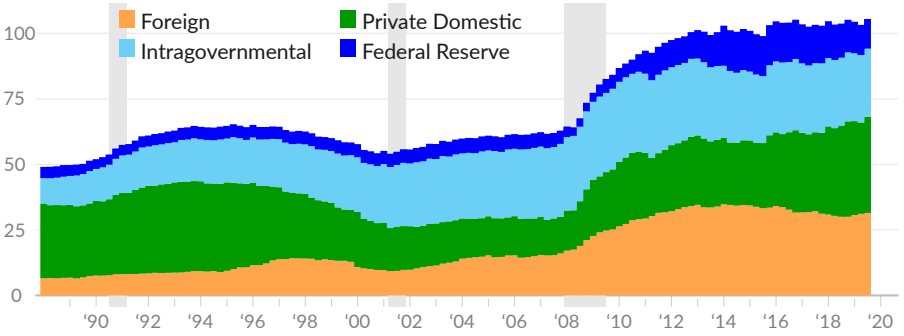
Government Balance Sheets

Liabilities

In the third quarter of 2019, total public debt was $22.7 trllion, equivalent to 105.5 percent of GDP. Of this, $7.9 trillion, or 34.8 percent of the total, is held by private domestic investors (see ■). An additional $6.8 trillion, or 29.8 percent of the total, is held by foreign investors (see ■). The remainder is held by the Federal Reserve (see ■) and various government agencies and trusts (see ■), such as the Social Security Trust Fund.

Total Public Debt By Holder

percent of GDP



Source: Treasury

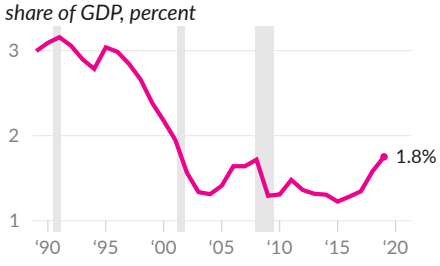
The ratio of public debt to GDP is fairly stable, and the interest income from holding public debt is lower than in the past because of lower interest rates. Treasuries and other government debt securities provide a safe asset for the balance sheets domestic households and businesses, and for foreign investors.

Interest Expense

The Office of Management and Budget reports federal interest outlays of $375.2 billion in fiscal year 2019, compared to $325.0 billion in fiscal year 2018. Put into the context of the size of the economy, federal interest outlays in 2019 were equivalent to 1.8 percent of GDP, 1.6 percent of GDP in 2018, and an average of 2.9 percent in the 1990s, when interest rates were substantially higher.

Federal Interest Outlays

share of GDP, percent



Source: FRED; OMB

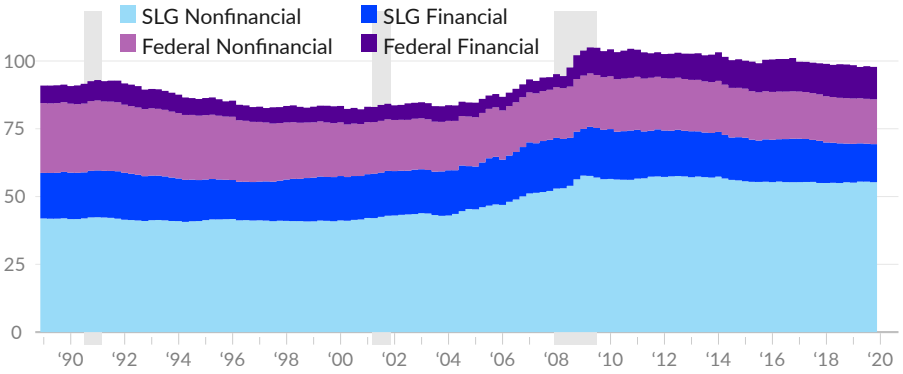
While debt levels are much lower for the consolidated state and local government sectors, interest rates on municipal bonds are higher, and interest paid to investors is a larger share of government expenses at the state and local level.

Assets

US government assets include financial assets but are mostly comprised of the non-financial assets of state and local governments (SLG), such as buildings and equipment. Land is not included in US measures of government assets.

Government Assets

does not include land, percent of GDP



Source: Federal Reserve

International Transactions

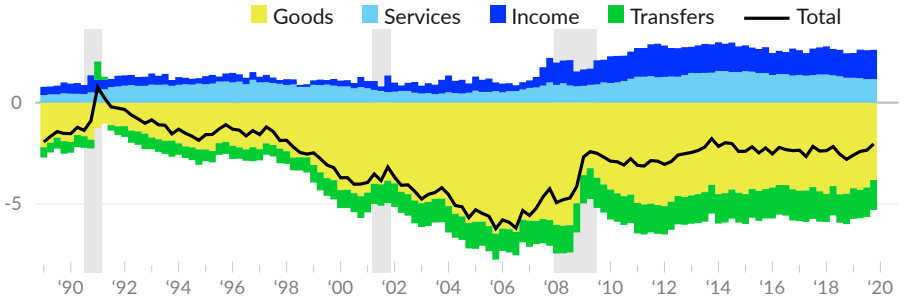
Transactions between the US and the rest of the world are recorded in the balance of payments as either current account transactions (which measure income) or capital and financial account transactions (which measure change in ownership of assets). This section details imbalances in international transactions, changes in trade by goods and by partner, international investment positions, and exchange rates.

Balance of Payments

The **current account balance** can be decomposed into the balance on trade in goods (see), the balance on trade in services (see), the balance on primary income (such as wages or income from assets, referred to here as income [see]), and secondary income (such as remittances and taxes, referred to here as transfers [see]). As of 2019 Q4, the US runs a current account deficit of 2.0 percent of GDP, primarily as the result of a trade deficit on goods of 3.8 percent of GDP.

Current Account Balance

balance on individual current account component, as percent of GDP



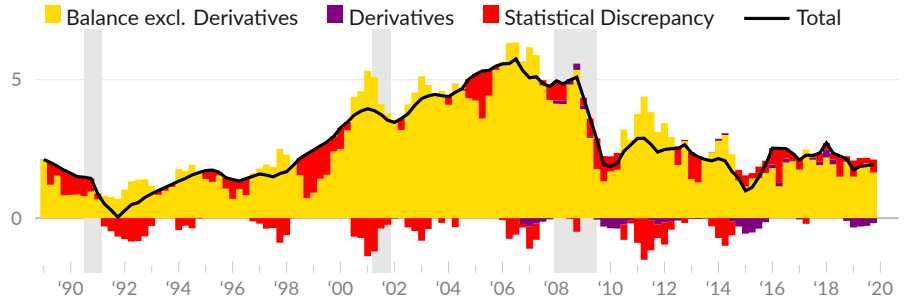
Source: Bureau of Economic Analysis

Financial account transactions include the net domestic acquisition of foreign assets and the net domestic incurrence of foreign liabilities. The US **financial account balance** (see) is the net lending or borrowing of the combined domestic sectors with the rest of the world. The timing of payments lead to a statistical discrepancy (see), but the financial and capital account balance and current account balance otherwise sum to zero.

Over the year ending 2019 Q4, net domestic acquisitions of foreign assets were equivalent to 2.0 percent of GDP, while net domestic incurrence of foreign liabilities total 3.6 percent of GDP. Domestic net borrowing totals 1.9 percent of GDP.

Financial Account Balance

percent of GDP



Source: Bureau of Economic Analysis

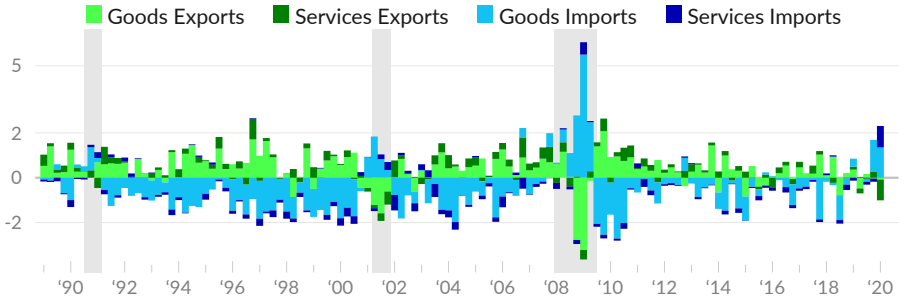
Trade

The **trade balance** (exports of goods and services minus imports of goods and services) acts as an adjustment to consumption and investment in GDP calculations. As the US runs a persistent trade deficit, trade will generally subtract from GDP growth. In the income approach, the expanded trade deficit reduced nominal compensation of employees (extensive margin through outsourcing, intensive margin through lower wages from labor market slack) and reduced prices.

Goods exports subtracted 0.08 percentage point from GDP growth in the first quarter of 2020 while services exports subtracted 0.93 percentage point. Good imports contributed 1.35 percentage points to GDP growth and services imports contributed 0.96 percentage point.

International Trade

percentage point contribution to real GDP growth

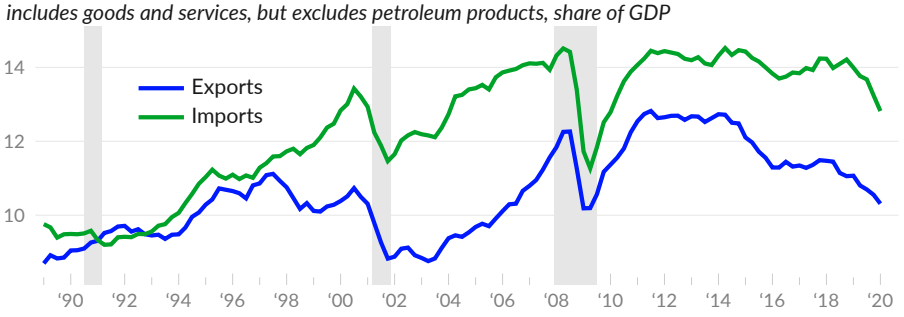


Source: Bureau of Economic Analysis

Nonpetroleum goods and services imports (see —) were equivalent to 12.8 percent of GDP in the first quarter of 2020, while exports of nonpetroleum goods and services (see —) were equivalent to 10.3 percent of GDP.

Imports and Exports, Nonpetroleum

includes goods and services, but excludes petroleum products, share of GDP



Source: Bureau of Economic Analysis

Changes to the trade balance can come from many sources, such as changes in domestic or foreign preferences and income, changes in exchange rates, and changes in trade policy. The following table captures the nominal value of major categories of goods and services as a share of nominal gross domestic product at various points over the past 30 years.

Exports and Imports by Type

percentage point share of GDP

Import Penetration

Goods can be produced domestically or imported or some combination of the two. The import share of the total US demand for goods, measured as US produced goods and imported goods less exported goods, is also referred to as *import penetration*. This measure has risen considerably over the past thirty years. The majority of the long-term increase has been concentrated in consumer goods, while the decrease since 2011 has come primarily from petroleum and products.

As of 2020 Q1, imports of consumer goods excluding petroleum and petroleum products are equivalent to 15.6 percent of domestic consumption of goods (see ■). Petroleum-related imports claim 2.7 percent (see ■) and imports of all other goods, primarily capital goods, industrial supplies, and materials are equivalent to 15.2 percent (see ■).

From 1989 to 2011, imports of consumer goods excluding petroleum increased by the equivalent of 5.7 percent of domestic consumption of goods; petroleum and products imports increased by the equivalent of 6.3 percent; and all other goods increased by the equivalent of 6.4 percent. Since 2011, imports of consumer goods decreased by the equivalent of 0.8 percent of domestic goods demand; imports of petroleum and products decreased by the equivalent of 5.7 percent; and other imports decreased by the equivalent of 1.1 percent.

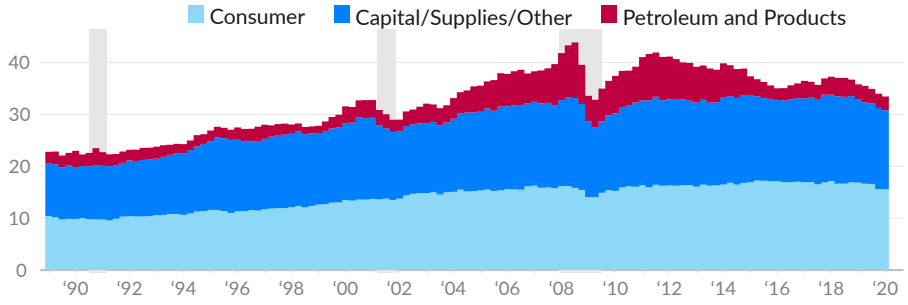
import share of domestic-produced and imported goods less exports, by category



Source: Bureau of Economic Analysis

The US Census Bureau reports monthly data on US trade in goods, including by partner country. In March 2020, trade with the top 25 trading partners (see table) comprises 85.3 percent of total US trade in goods.

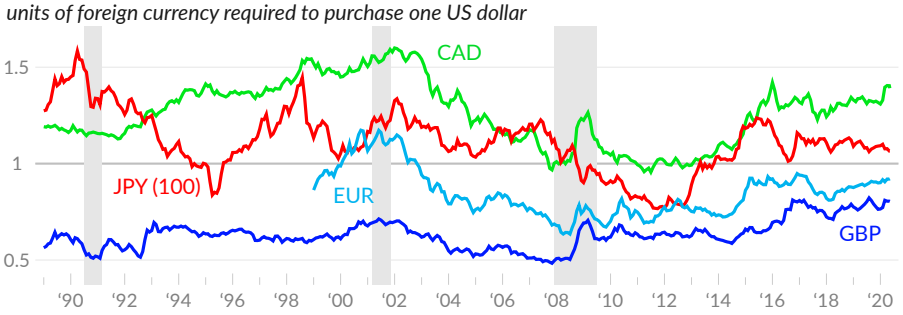
Exchange Rates

Changes in the strength or weakness of the US Dollar (USD) can affect trade and financial flows. The dollar is said to be relatively strong when more units of foreign currency, for example Japanese Yen (JPY), British Pounds (GBP), Euros (EUR), or Canadian Dollars (CAD), are required to buy one USD.

As of May 8, 2020, one US dollar buys approximately: 1.39 Canadian dollars (see —), 106 Japanese Yen (see —), 0.92 Euros (see —), and 0.80 British Pounds (see —). Over the past three years, the nominal exchange rate between the US dollar and the Canadian dollar increased by 3.4 percent, the USD-JPY rate decreased by 3.3 percent, the USD-EUR rate increased by 3.2 percent, and the USD-GBP rate increased by 4.6 percent.

Selected Exchange Rates

units of foreign currency required to purchase one US dollar



Source: Federal Reserve

Broad Dollar Index

trade-weighted foreign exchange rate index
January 2006=100

Source: Federal Reserve

Fed trade-weighted dollar indices show weighted-average foreign exchange rates with US trading partners, which simplify thinking about the overall role of foreign exchange rates on the US external sector. The Broad Dollar Index (see —), which starts in 2006, summarizes foreign exchange rates between the US and trading partners, weighting rates by the amount of trade in both goods and services.

The latest index value, as of May 8, 2020, is 122.9, an increase of 22.9 percent since inception in 2006. Over the past three years, the index value has averaged 114.4, compared to an average of 108.0 over the previous three-year period.

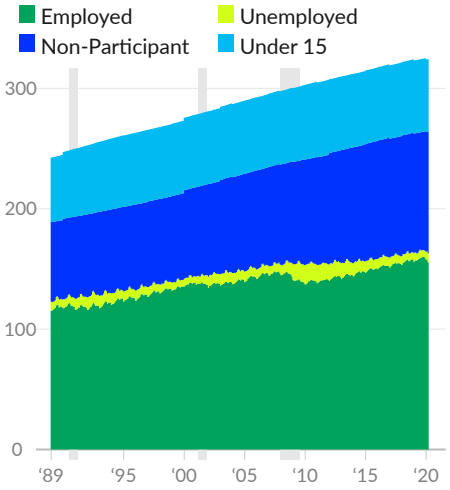
Labor Markets

Labor is the primary source of income for US households and is essential to the production of goods and services. The portion of labor that is provided by a household member to others outside of the household or to other households is considered *employment*. As of March 2020, 155.5 million people are employed (including self-employment).

Labor provided within a household is not captured by GDP compilation methods (expenditures, output, or income), though household surveys offer some insight into this important category of labor. The number of people who are considered employed divided by the total population is the employment rate or employment-to-population ratio, which is 48.0 percent as of March 2020.

Labor Force Status of Population

millions of people



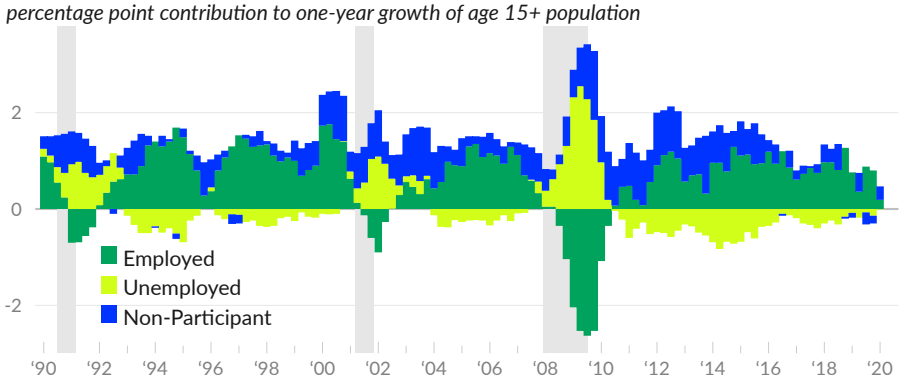
Source: Author's Calculations from CPS

When a member of a household is not employed but looked for a job during the past four weeks or is on temporary layoff, they are considered **unemployed**. As of March 2020, there are 7.5 million unemployed people. The combined group of employed and unemployed people is the labor force. The number of unemployed people divided by the number of people in the labor force is the unemployment rate, currently 4.6 percent. The number of people in the labor force divided by the total population is the labor force participation rate, currently 50.3 percent.

People who are not employed and not unemployed are considered to be outside of the labor force. This category is about half of the population, on average, and totals 161.3 million in March 2020. The category is comprised of children (60.4 million), students (19.0 million), unpaid caregivers (12.0 million), those unable to work due to disability or illness (14.6 million), those who want a job but have given up looking (4.3 million), and retirees and the elderly (47.3 million).

Labor Force Status Changes

percentage point contribution to one-year growth of age 15+ population



Source: Author's Calculations from CPS

The labor force status of the US population varies by age, sex, and over time. Because very few people receive capital income, the share of the population with labor income is particularly important to overall levels of economic activity.

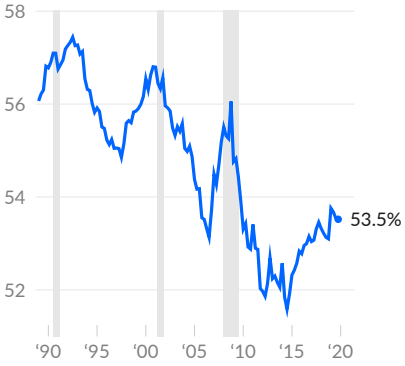
Labor Share of Income

compensation of employees as share of gross domestic income, percent



Source: Bureau of Economic Analysis

The labor share of income measures how much labor is paid relative to the total income in the economy in a year. While the laborer share of the population has fallen, and an increasing share of income goes to depreciation of capital including housing, cyclical patterns suggest worker bargaining power also affects the labor share of income. As of the fourth quarter of 2019, labor receives 53.5 percent of gross domestic income, and the labor share increased by a total of 0.4 percentage point over the past year. The labor share is 1.9 percentage points above its 30-year low of 51.6 percent in 2014 Q3, but 3.9 percentage points below the 30-year high of 57.4 percent in 1992 Q3.

Gross Labor Income

In labor markets, unlike other markets, wages (the price of labor) tend not to be cut in response to a decrease in demand; businesses instead employ fewer workers and/or cut hours. As a result, wage data give only a partial picture of the labor income received by households.

Gross labor income (compensation of employees in the national accounts), which captures both the amount of employment (see ■) and the rate of compensation (see ■), decreased at an annualized and inflation-adjusted rate of 0.95 percent in 2020 Q1. Changes in wages contributed 3.48 percentage points, amd changes in total hours worked subtracted 4.43 percentage points.

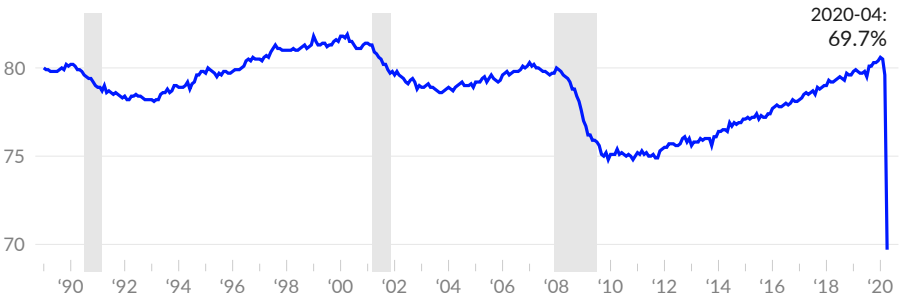
Employment

In April 2020, 69.7 percent of 25-54 years olds were employed, the lowest level in the data April 2020. Over the past year, the age 25-54 employment rate has fallen by 10.0 percentage points. The current age 25-54 employment rate is 11.6 percentage points (equivalent to 14.6 million workers) below the average during 1998–99, a period with a particularly tight labor market.

Employment Rate

employed share of age 25-54 population



Source: Bureau of Labor Statistics

The employment rate shown above is based on a monthly survey that asks about employment during a specific week of the previous month. However, additional data is available on what share of a population works year-round rather than just during a specific week. This can be combined with data on hours worked to identify the *fully-employed*, or *full-time, full-year workers*, who are defined below as the those who usually work 35 hours per week or more for 50 weeks per year or more. The Census Bureau reports 118 million fully-employed people in 2018, equivalent to 36 percent of the population.

In 2018, fewer than half (43.0 percent) of commuter zones have at least a third of their population working full-time and full-year. A total of 18 commuter zones (out of 741), covering 2.6 million people, have a quarter of the population or less fully employed. Of commuter zones with 100,000 people or more, the top and bottom ten by fully-employed share of population are listed below.

Changes in Payroll Employment

The establishment survey from the monthly jobs report identifies how many jobs have been added to the economy in a given month (see ■). The US economy lost 20,500,000 jobs in April 2020, compared to 870,000 lost in March 2020, and an average of 7,047,000 lost over the past three months. Over the same three months, the US needed to add an average of 151,000 jobs per month to maintain a steady employment rate.

Employment rates vary over time, but also by age, gender, and education. Over the 12 months ending March 2020 , the employment rate for most education groups is lower than it was on average in the year 2000. Only older workers and women with advanced education have higher rates of employment than in 2000.

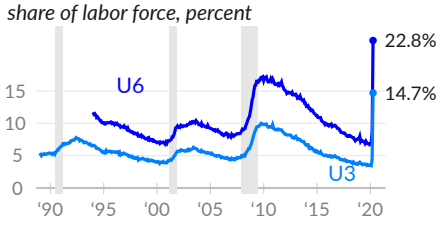
Unemployment

The headline unemployment rate, also known as the U3 unemployment rate, measures people who do not have a job but are looking for one or are on temporary layoff, as a share of the labor force (those employed and unemployed). BLS reports 23.1 million unemployed persons in April 2020, and an unemployment rate of 14.7 percent (see —), far above the March 2020 rate of 4.4 percent.

BLS also reports a broader measure of unemployment, known as U6. This labor under-utilization rate measure includes unemployed people counted in U3 as well as people who have given up looking for work and people who are part-time but would like to work full-time (part-time for economic reasons). In April 2020, the labor under-utilization rate is 22.8 percent (see —).

Unemployment Measures
share of labor force, percent



Source: BLS

Unemployment is much more common for disadvantaged groups, with the black or African American unemployment rate typically double the white unemployment rate. A very tight labor market may have the effect of reducing racial discrimination in hiring. However, disadvantaged groups are more likely to lose jobs in a downturn. As a result, the full-employment period of the business cycle is quite short for many people. Since February 2020, the black or African American unemployment rate has increased by 10.9 percentage points to 16.7 percent (see —).

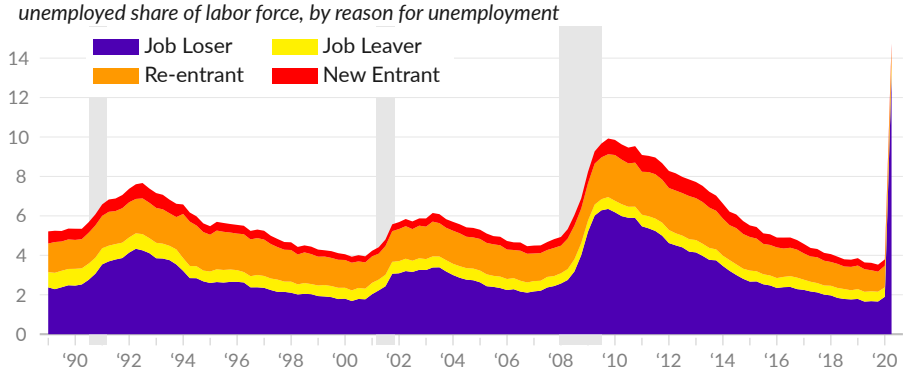
Reasons for unemployment

There are multiple reasons for unemployment. During the trough of a business cycle, most unemployed are those who lost a job, for example from layoffs, or had a temporary job end (see ■). In general, many of the unemployed are re-entrants to the labor market, meaning they were out of the labor force prior but are looking for a job again (see ■). Some are new-entrants who are looking for their first job (see ■). A small portion are also those who left a job voluntarily and are looking for a new one (see ■).

In April 2020, 13.2 percent of the labor force were unemployed because of losing a job or having a temporary job end. Of these, 11.5 percent of the labor force are unemployed due to temporary layoff, equivalent to 78.3 percent of the unemployed. Additionally, 0.4 percent of the labor force were re-entrants, 0.9 percent were new entrants, and 0.2 percent were job leavers.

Unemployment by Reason

unemployed share of labor force, by reason for unemployment

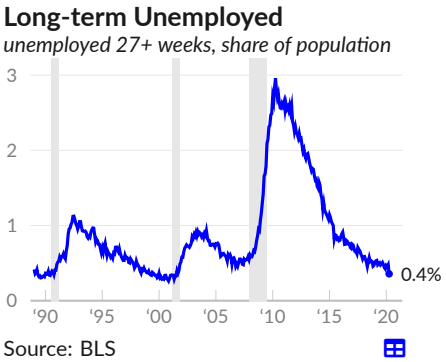


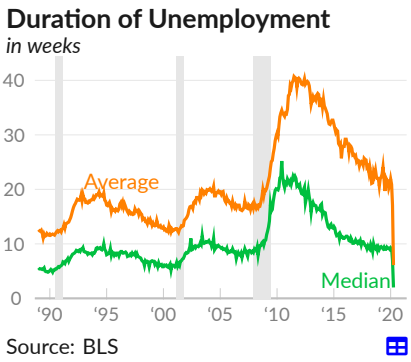
Source: Bureau of Labor Statistics

Duration of unemployment

When someone is unemployed for an extended period of time they risk running out of unemployment benefits, thereby having a sharp reduction in income. Additionally, people may have more trouble re-entering the labor market after a long period of unemployment.

As of April 2020, BLS reports that 0.36 percent of the age 16+ population have been unemployed for 27 weeks or longer, compared to 0.48 percent in April 2019. Long-term unemployment peaked at 2.96 percent of the population in April 2010. Among those who are unemployed, the average (mean) duration of unemployment is 6.1 weeks, and the typical (median) duration of unemployment is 2.0 weeks, as of April 2020. Both measures of unemployment duration are elevated from the levels typically seen several years into an expansion.

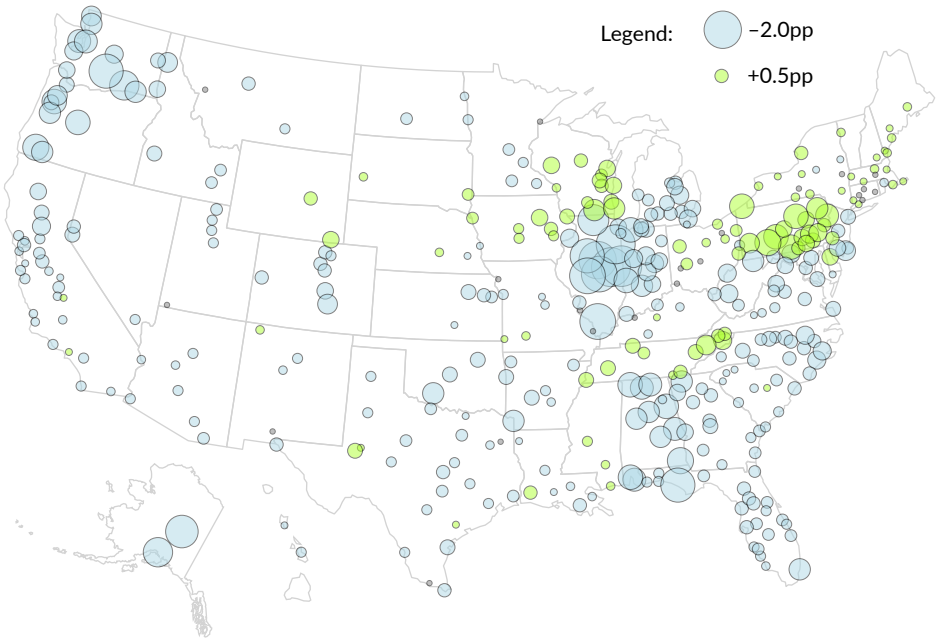




Unemployment by metro area

The Bureau of Labor Statistics produce local area estimates of unemployment, including the **unemployment rate for metro areas**.

Change in Unemployment Rate by Metro Area
one-year change, in percentage points, February 2020



Source: Bureau of Labor Statistics

Initial Jobless Claims

The Department of Labor reported 2,849,090 actual new claims for unemployment insurance during the week ending May 2, 2020, a one-week decrease of 646,600. Over the past four weeks, new claims have averaged 3,897,900 per week. During the same four-week period last year, there were an average of 204,200 new claims per week.

New UI Claims

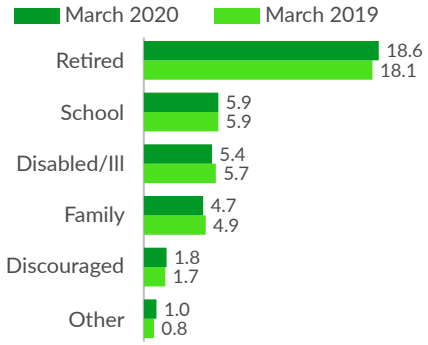
Source: Department of Labor

Reasons for labor force non-participation

The Current Population Survey (CPS) asks those who are not employed or looking for work about their major activities and reasons for not participating in the labor market. Answers vary by age in intuitive ways, and are influenced by labor market conditions.

Labor Force Non-Participation
share of age 15+ population, percent



Source: Author's calculations from CPS

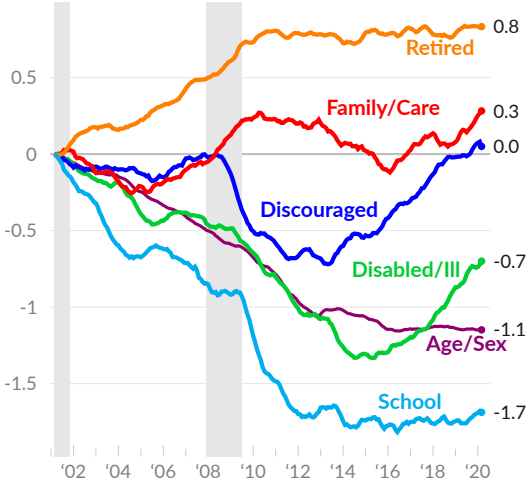
These labor force non-participants, which do not include those under the age of 15, total 97.2 million in March 2020, or 37.4 percent of the age 15 or older population, compared to 37.0 percent in March 2019. Slightly less than half of non-participants, and 18.6 percent of population, are retirees in March 2020 (see ■). A total of 14.1 million people, or 5.4 percent of the age 15 or older population, are out of the labor force due to disability or illness; 5.9 percent were out of the labor force for school, and 4.7 percent for family or caregiving reasons.

While the recession of 2001 appears mild in measures of expenditure, it was followed by a substantial reduction in the share of the population receiving labor income. The economy was losing jobs at an alarming rate long after the 2001 recession had officially ended, though labor market weakness was partially masked by a major housing bubble. Seven years after the recession of 2001, the burst of the housing bubble caused the great recession, which pushed many more people out of the labor force.

From March 2001 to the latest available twelve months of data, ending March 2020, an additional 2.4 percent of the age 18–64 population left the labor force. Changes in the demographic composition of the population affect the rate of participation. For example, the larger-than-normal population cohort born after World War II is reaching retirement age in this period. Changes in the age and sex distribution explain 1.1 percentage points of the cumulative decrease since March 2001 (see —).

Additionally, young people are staying in school longer, on average, reducing the age 18–64 labor force by 1.7 percent (see —). Disability and illness reduce the labor force by another 0.7 percent (see —). Less retirement among those age 18–64 increases the labor force by 0.8 percent, over the period (see —).

Contribution to Labor Force Participation
cumulative percentage point contribution to age 18-64 labor force participation rate since March 2001



Source: Author's Calculations from CPS

Series in the chart are adjusted so that the distribution of the age 18–64 population by age and sex is constant and equal to its March 2001 value. The total effect of this adjustment on labor force participation is included separately in the chart, as **Age/Sex**.

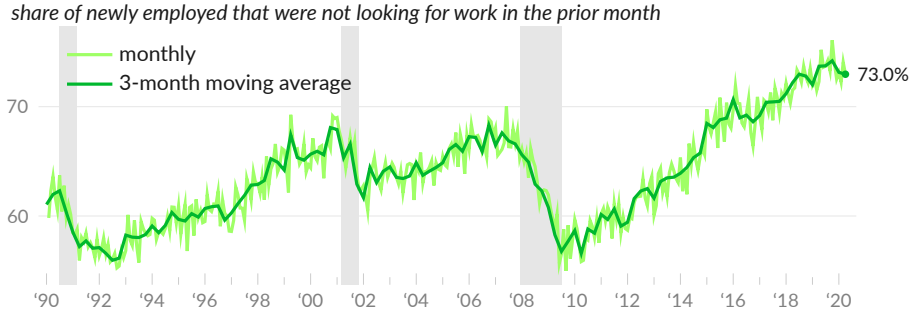
Labor Force Flows

The current population survey interviews households up to eight times over 16 months, allowing insight into the labor force status of the same individual over time, and in particular, into **flows between different employment, unemployment, and other categories**. The Bureau of Labor Statistics publishes many monthly indicators based on labor force flows, and others can be calculated directly from the public use data.

Among newly employed workers, the vast majority were considered to be out of the labor force the prior month, as opposed unemployed. In April 2020, 4.6 million people were newly employed (on a gross basis). Of these, 73.0 percent were not looking for work in the prior month (see —). Over the past three months, an average of 73.0 percent of the newly employed were not looking for work the month prior (see —). With low unemployment, new employees are being pulled from outside of the labor force and bypassing unemployment. Three years ago, in April 2017, 70.4 percent of the newly employed were not looking for work month prior.

Newly Employed, Not Previously Looking For Work

share of newly employed that were not looking for work in the prior month



Source: Bureau of Labor Statistics

The great recession worsened job-finding prospects for those not in the labor force (NILF) due to disability or illness. As a result, the flow into employment for people age 25 to 54 who are out of the labor force due to a disability or illness slowed considerably. Only over the past few years have these prospects recovered. Over the year ending March 2020, 9.2 percent of persons age 25–54 who were out of the labor force due to disability or illnessin the prior year are now employed (see —). This one-year rate of job-finding has increased substantially from its 2010–2013 average of 5.8 percent

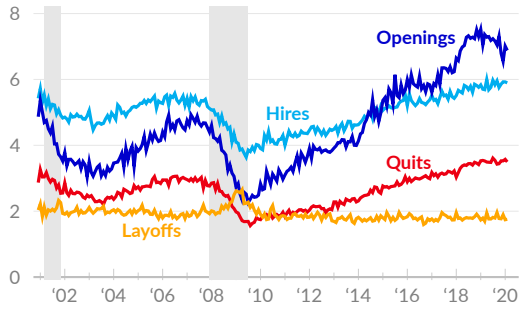
Job Openings and Labor Turnover Survey

Some types of **turnover** in the labor market are healthy and mean people are better able find a new job if they do not like the one they have. Additionally, the job prospects outside of a firm affect the bargaining power of the workers inside of the firm. The Bureau of Labor Statistics reports the number of job openings, hires, and separations in several industry groups on a monthly basis. Within separations, these data distinguish voluntarily leaving a job as *quits*.

In February 2020, there were 6.9 million total nonfarm job openings and 5.9 million hires completed. In the same month there were 5.6 million nonfarm separations, of which 3.5 million were voluntary. In comparison, there are 5.8 million unemployed persons in February 2020. The ratio of job openings to unemployed persons was 1.2 in the latest month, compared to 1.2 in the same month one year prior, and 0.8 in February 2017.

Job Turnover

job openings, hires, quits, and layoffs, in millions

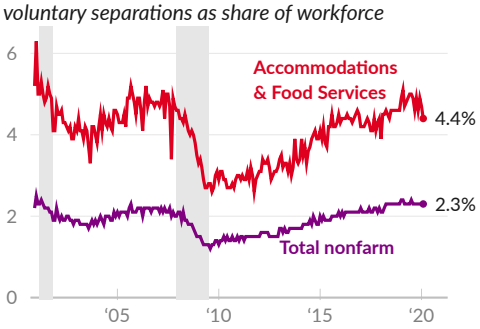


Source: Bureau of Labor Statistics

The number of people who voluntarily separate (quit) a job in a given month, divided by the total number employed is the *quits rate*. The rate typically increases when workers are confident enough to leave one job for another one, and a high quits rate, particularly in low-paying industries, can be a sign of a tight labor market.

Quits Rate

voluntary separations as share of workforce



Source: Bureau of Labor Statistics

The quits rate within the accommodations and food services industries (which includes restaurants), is highly cyclical, and tends to rise when a tight labor market pulls people out of restaurant jobs and into higher paying jobs in other industries. In February 2020, the total quits rate in all industries was 2.3 percent. The accommodations and food services quits rate was 4.4 percent; the series high for the industry group was 6.3 percent in January 2001.

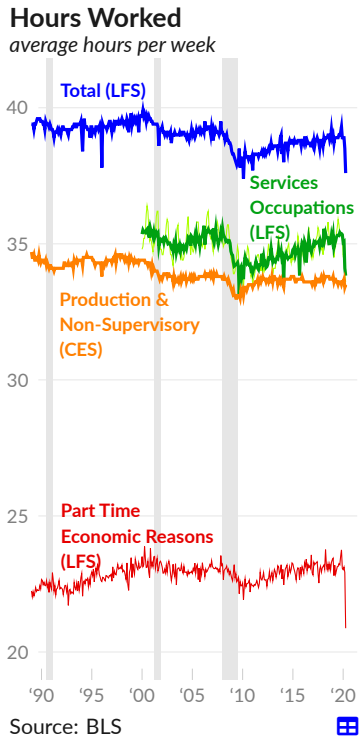
Hours Worked

The Bureau of Labor Statistics (BLS) reports hours worked per week in both Current Employment Statistics (CES) and Labor Force Statistics (LFS).

Weekly hours for the total group of people at work in all industries average 37.6 in April 2020 (see —) slightly below the 38.9 average weekly hours in February 2020. Weekly hours for this group average 39.6 from 1998 through 2000, and fell to a great recession low of 37.4 in February 2010.

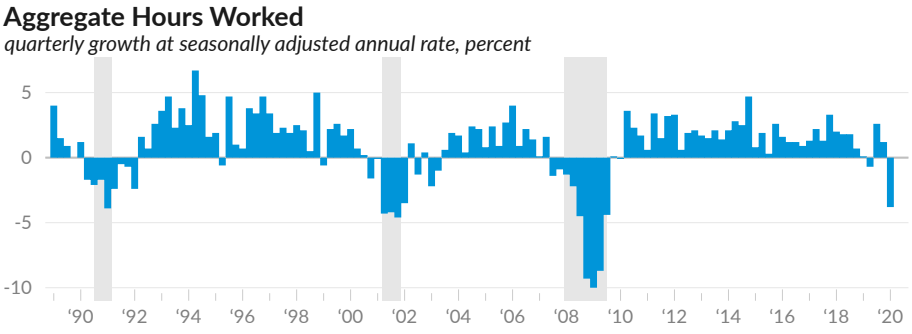
Those in service occupations (see —) work fewer hours on average, with 33.8 average weekly hours in April 2020, substantially below the 35.1 average in February 2020. Those part-time for economic reasons (see —) work an average of 20.9 hours per week in April 2020.

In April 2020, production and non-supervisory workers (see —), about four of every five employees, worked 33.5 hours per week on average, slightly below the 33.7 average weekly hours in February 2020 and substantially below the 1998–2000 average of 34.4 hours.



Source: BLS

BLS also reports a quarterly index tracking aggregate hours worked in nonfarm businesses (see ■). Total hours worked in nonfarm businesses decreased at an annual rate of 3.8 percent in 2020 Q1, following an increase of 1.2 percent in 2019 Q4.



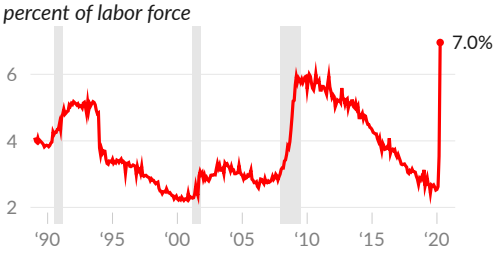
Source: Bureau of Labor Statistics

Part-time Work

Part-time workers who would prefer full-time work are referred to as involuntary part time or part time for economic reasons in the labor force statistics produced by the Bureau of Labor Statistics. This group is comprised of people who don't have enough hours because of slack business conditions or who are unable to find full-time work.

Part Time, Economic Reasons

percent of labor force



Source: Bureau of Labor Statistics

As of April 2020, 10,887,000 people are working part time because of economic reasons, equivalent to 7.0 percent of the labor force (see —), the highest level in the data April 2020 and far above the February 2020 rate of 2.6 percent. During the great recession, the involuntary part-time share of the labor force peaked at 6.0 percent in September 2010.

Wage Growth

The **usual wages of full-time workers** can be measured at various points in the income distribution using the Current Population Survey. BLS reports these data by decile and quartile, with the most commonly used measure being the median usual weekly earnings. The **first decile** usual weekly earnings of full-time workers have increased rapidly over the past year, suggesting fewer people are working full-time for less than $10 per hour.

BLS calculations (see —) for 2020 Q1 show nominal first decile usual weekly earnings of $468.00, compared to $442.00 in 2019 Q1, resulting in one-year growth of 5.9 percent. In the previous quarter, 2019 Q4, first decile usual weekly earnings grew by 5.2 percent over the year. Author's calculations from the CPS (see —) show three-month moving average first decile usual weekly earnings of $468.00 in March 2020, $461.00 in February 2020, and $441.00 in March 2019. One-year growth was 5.0 percent for the three months ending March 2020, 5.0 percent for the three months ending February 2020, and 6.0 percent for the three months ending January 2020.

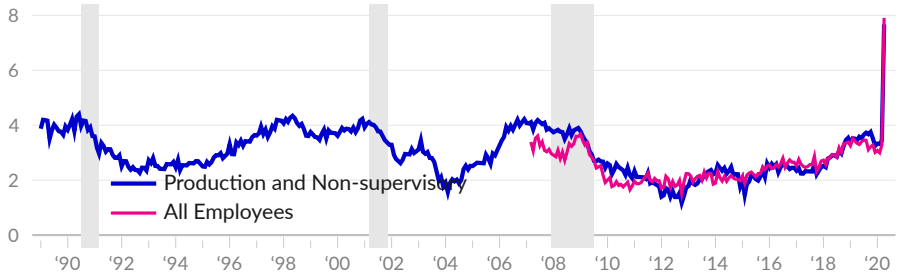
Nominal Hourly Wages

Over the year ending April 2020, nominal wages increased by 7.9 percent for all employees (see —) and increased by 7.7 percent for production and non-supervisory workers (see —), according to the Bureau of Labor Statistics. Comparing the latest three months to the previous three months, nominal wages increased at an annual rate of 10.0 percent for all employees and increased at an annual rate of 9.4 percent for production and non-supervisory employees.

Average Hourly Earnings
nominal one-year growth, percent



Source: Bureau of Labor Statistics

By industry, 11 of 12 groups experienced real wage growth (wage growth above the increase in prices indicated by the consumer price index). The professional & business services industry had the fastest nominal growth rate, at 8.0 percent, followed by 7.7 percent in total private and 6.8 percent in retail trade.

Average Hourly Earnings Growth by Industry
one-year growth, production and non-supervisory, April 2020

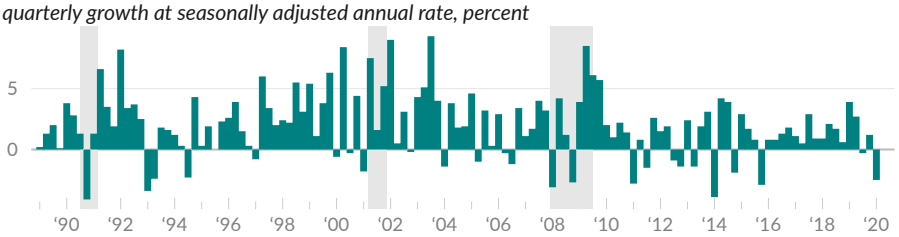
Labor Productivity

Labor productivity is reported by the Bureau of Labor Statistics and measured as **real output per hour of work** in the nonfarm business sector. Economic theory suggests that labor productivity is particularly important for long-term real economic growth. The measure captures the rate at which people, with all of the resources and equipment and infrastructure available to them, are able to produce goods and services with their work. An increase in labor productivity means real wages can increase without putting upward pressure on inflation. Alternatively, an increase in productivity means a society can meet its material needs with less work.

In 2020 Q1, labor productivity decreased at an annual rate of 2.5 percent (see ■), as the result of a decrease of 6.2 percent in real ouput and a decrease of 3.8 percent in hours worked. In the prior quarter, 2019 Q4, labor productivity increased at an annual rate of 1.2 percent, as real output increased at an annual rate of 2.4 percent and hours of work increased at an annual rate of 1.2 percent. Over the past five years, labor productivity growth has averaged 1.0 percent, substantially below the 1989-onward average of 1.9 percent.

Labor Productivity Growth

quarterly growth at seasonally adjusted annual rate, percent



Source: Bureau of Labor Statistics

There are two areas to investigate in understanding trends in productivity growth rates. The first is the theory that the level of business net investment in equipment and other capital goods, particularly relative to the size of the workforce, determines productivity growth. Such investment allows more goods and services to be produced by the same number amount of work. The second theory, sometimes called the *Kaldor-Verdoorn Law*, is that overall economic growth and capacity utilization determine productivity growth. In this scenario, an economy facing real resource constraints is more likely to find ways to produce goods and services more efficiently.

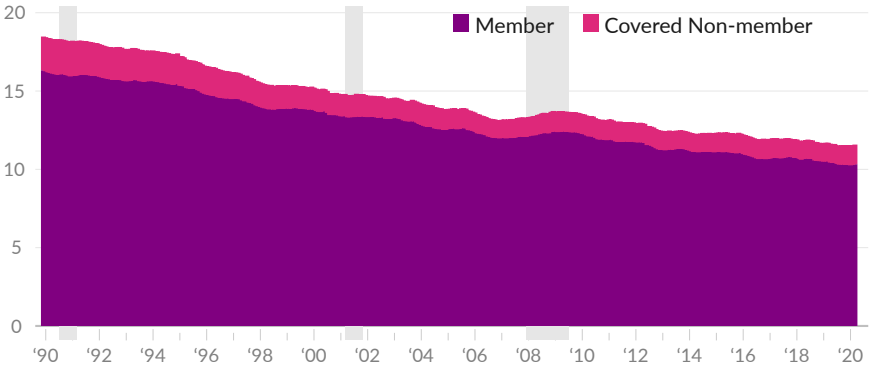
Union Membership

Membership in **unions and employee associations** has diminished in the United States over the past fifty years. Unionized jobs typically offer higher wages and better benefits and union membership tends to increase wages and benefits even in nonunion jobs. Therefore, some research argues, less union membership increases income inequality.

Over the 12 months ending March 2020, the share of jobs held by union and employee association members averaged 10.3 percent. In levels, there were 14.7 million union jobs, and 127.2 million nonunion jobs, on average over the period. This union membership rate averaged 10.5 percent during the 12 months ending March 2019, and 10.6 percent during the 12 months ending March 2018. Union jobs decreased by 135,000 from March 2019 to March 2020, while nonunion jobs increased by 1,408,000.

Union Membership and Coverage

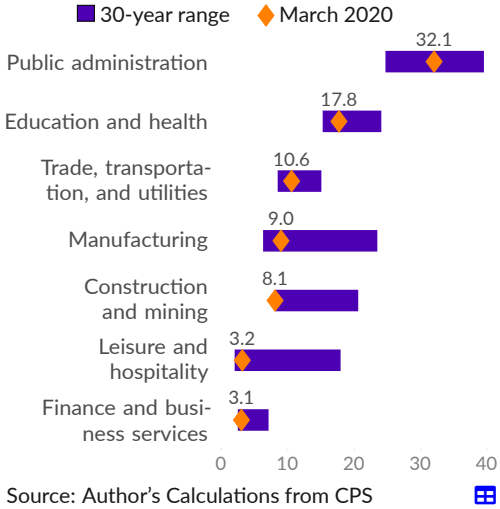
union or employee association share of jobs, percent



Source: Author's Calculations from Current Population Survey

Union Membership Rate by Industry

union or employee association member, percent



Source: Author's Calculations from CPS

Union membership rates vary substantially by industry. Public administration has the highest union membership rate, at 32.1 percent as of March 2020, followed by education and health with 17.8 percent, and trade, transportation, and utilities with 10.6 percent. The leisure and hospitality industry experienced the largest overall percentage point decrease in union membership rates over the past 30 years, and is currently 14.8 percentage points below its January 1989 rate of 18.0 percent. The lowest union membership rate is in finance and business services (3.1 percent). The union membership rate of the industry was 7.2 percent at its 30-year peak in March 1992.

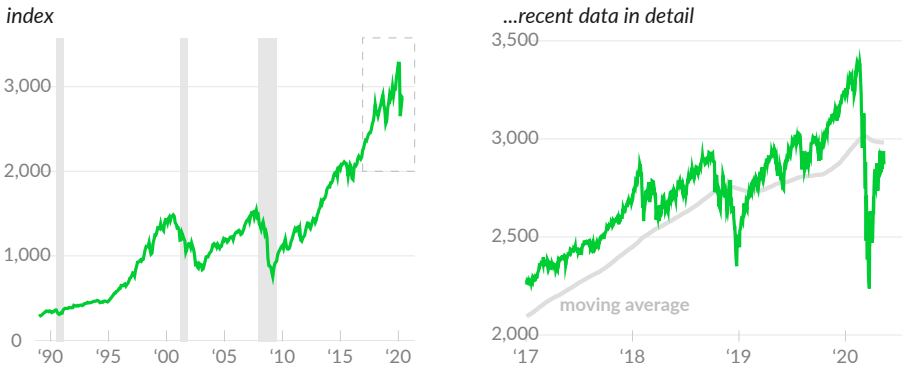
Financial Markets

The US equity markets and capital markets provide businesses and governments with funding for activities and fixed investments.

Equity Markets

The S&P 500 (see —) is a market-cap-weighted stock market index based on 500 large companies listed on US exchanges. The index is a broad measure of price levels in US equity markets. The S&P 500 closed at 2870 on May 12, 2020. The index is currently 15.4 percent below its one-year high of 3394 on February 19, 2020, and 30.9 percent above its one-year low of 2192 on March 23, 2020. The average over the past year is 2982; the index is 3.8 percent below its one-year moving average (see —).

S&P 500
index



Source: Yahoo! Finance

According to historical stock market data from Robert Shiller, the inflation-adjusted trailing twenty year annual rate of return of the S&P 500 was 3.8 percent as of December 2019. Real returns are currently low relative to the average trailing twenty year real annual return of 10.1 percent during 1995–2005.

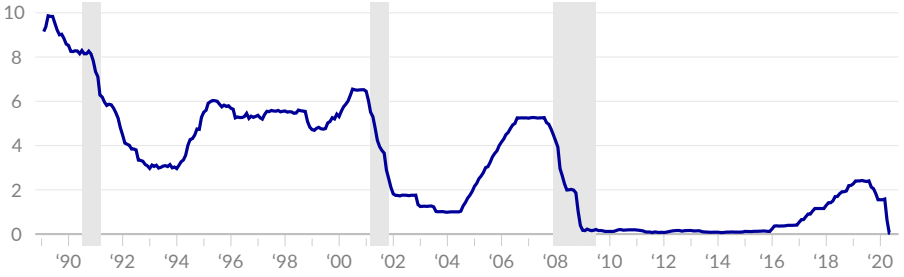
Interest Rates

The US Federal Reserve System (Fed) has a congressional mandate to promote price stability and maximum employment. In practice, a Fed committee (FOMC) determines the federal funds rate, which aims to influence interest rates in the broader economy. Fed monetary policy can be neutral or be used to stimulate or slow the economy.

The effective fed funds rate (see —) is 0.05 percent, as of May 11, 2020. The FOMC cut interest rates three times in 2019, for a total reduction of 75 basis points. Responding to the economic shock of the coronavirus, the FOMC cut rates twice in March 2020, by 150 basis points, bringing the lower bound of the federal funds rate range to zero. With rates near zero, the Fed has adopted several additional measures to increase liquidity in the global financial system.

Effective Fed Funds Rate

percent, monthly average except for latest value



Source: Federal Reserve

As of May 11, 2020, the constant maturity yield for a ten-year Treasury bond (see —) is 0.73 percent, compared to 2.40 percent one year prior. The yield for a two-year Treasury (see —) is 0.17 percent, compared to 2.21 percent a year prior.

Treasury Constant Maturity Yields

percent, monthly average except for latest value

Source: Federal Reserve

The **Treasury yield curve** shows the yield on different maturities of Treasury bonds and bills, usually from short-term, such as three-month, to long-term such as 30-year. This measure is at times described as *inverted*, which means the short-term-debt end of the curve is higher than the long-term-debt end. For example, if the yield on two-year treasuries is higher than the yield on ten-year treasuries.

As of May 11, 2020, the spread between a 10-year treasury bond and a three-month treasury bill is 0.61 percentage point (see —), compared to 0.02 percentage point one year prior. The spread between 10-year and 2-year treasuries (see —) was 0.56 percentage point on May 11, 2020, and 0.19 percentage point one year prior.

10-Year – 3-Month Spread

Corporate Bonds

The US Treasury publishes a yield curve for corporate bonds based on an market-weighted average of bonds rated AAA, AA, and A. This monthly measure shows a spot rate of 2.9 percent in March 2020 for high-quality corporate bonds with a maturity of 10 years, following a rate of 2.6 percent in February 2020. In March 2019, the spot rate was 3.9 percent.

10-Year, High Quality
spot rate, percent, monthly average

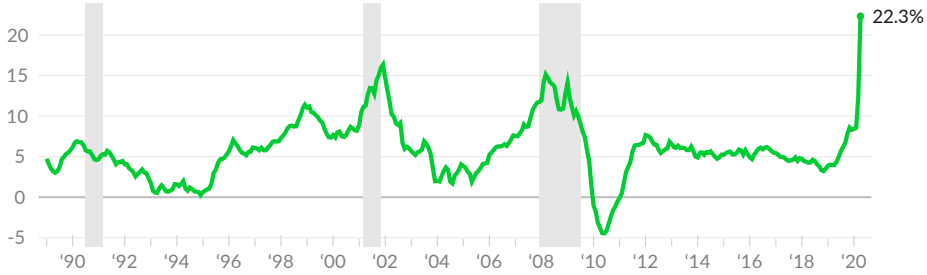
Money and Monetary Policy

The Federal Reserve reports the weekly average **money stock**, broadly, as M2, which includes cash and deposits such as savings accounts and checking accounts. In the week of April 27, 2020, the M2 measure of money averaged $17.5 trillion, equivalent to 81.2 percent of GDP. Institution money market accounts, which are not included in M2, can be combined with M2 to create a slightly-broader-than-M2 measure of the money stock. These funds averaged $3.2 trillion in the same week, equivalent to 14.7 percent of GDP.

A large increase in the amount of money held by individuals and institutions can be the result of a higher rate of saving, a larger government sector financial deficit, an increase in the money supply, a change in preferences for liquidity, or something else. In April 2020, the M2 plus institutional money funds measure increased over the equivalent previous year value by 22.3 percent.

M2 and Institutional Money Funds

one-year percent change, monthly average



Source: Federal Reserve

Fed Asset Purchases

During periods where the Fed funds rate is at or near zero the Fed has engaged in large scale asset purchases in an effort to further improve financial market conditions. These asset purchases show up on the Fed balance sheet, which is reported weekly.

In response to the collapse of the housing bubble, the Fed purchased U.S. Treasury bonds and mortgage-backed securities. Total assets held by the Federal Reserve (see —) increased from $0.9 trillion in August 2008 to $2.2 trillion in November 2008. Additional rounds of asset purchases, referred to as quantitative easing, increased the balance sheet to $4.5 trillion by January 2014. As bonds mature they were replaced until October 2017, when the Fed allowed the size of its balance sheet to normalize. Total assets fell below $3.8 trillion in August 2019.

Federal Reserve Balance Sheet

total assets, trillion of USD

Source: Federal Reserve

Balance sheet normalization ended in September 2019 when the Fed increased operations in overnight and term repurchase agreement (repo) markets, following a sharp increase in rates in these markets. The Fed balance sheet increased to $4.1 trillion by December 2019. More recently, in response to worsening financial conditions, the Fed began to purchase commercial bonds and to offer currency swaps with major US trading partners. The Fed balance sheet increased from $4.2 trillion in February 2020 to $6.7 trillion, as of the latest data, covering May 6, 2020. Fed total assets increased by $65 billion over the previous week value.

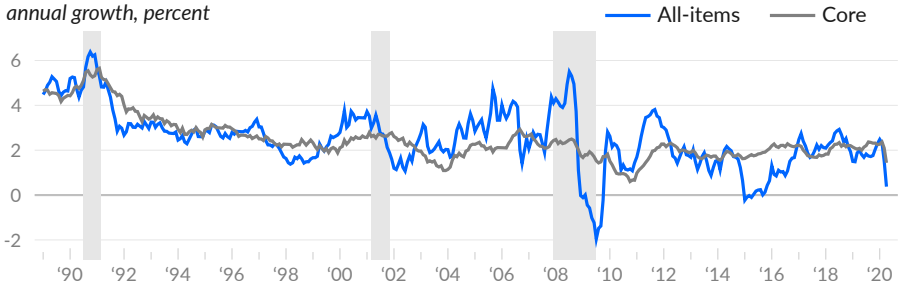
Prices

Changes in prices affect the amount of goods and services that can purchased by a fixed amount of income. When researchers try to measure changes in prices, they often look at both the quantity that can be purchased by a unit of currency, and also changes in item quality. To understand the overall change in prices faced by a certain group, such as consumers, researchers create a representative "basket" of the goods and services purchased by the group, and track the changes in the basket, and the price of the basket, over time.

Consumer Price Index

Consumer prices increased by 0.4 percent over the year ending April 2020, according to the CPI for all urban consumers. Core inflation, which does not include the more volatile food and energy prices, was 1.4 percent.

Consumer Price Index
annual growth, percent

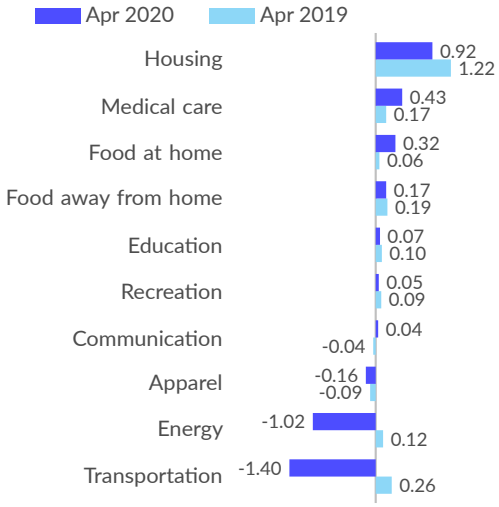


Source: Bureau of Labor Statistics

In April 2020, housing contributed 0.92 percentage points to overall CPI inflation, compared to a contribution of 1.22 percentage points in April 2019. Medical care contributed 0.43 percentage points to overall inflation in April 2020, compared to a contribution of 0.17 percentage points in April 2019.

Transportation subtracted 1.40 percentage points from overall CPI inflation in April 2020, compared to a contribution of 0.26 percentage points in April 2019. Energy subtracted 1.02 percentage points from overall inflation, compared to a contribution of 0.12 percentage points the previous year.

Consumer Price Index
contribution to annual growth, percentage points

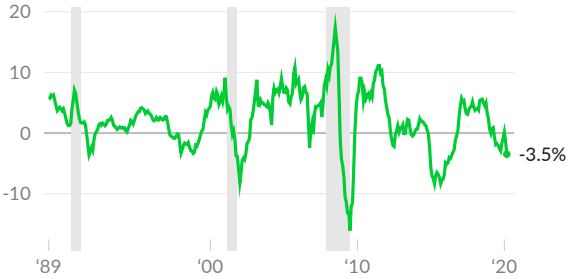


Source: Bureau of Labor Statistics

The consumer price index (CPI-U) is used in contracts that include cost adjustments. As a result, historical CPI-U data are not revised if there is a change to the way the CPI is calculated. For research purposes, however, it is ideal to have the most accurate measure of overall changes in prices faced by consumers. BLS also publishes a research series, the CPI-U-RS, which adjusts the historical data of the CPI-U to be consistent with the current methods of producing it.

Producer Prices

Producer Price Index
all commodities, annual growth, percent



Source: Bureau of Labor Statistics

The Bureau of Labor Statistics reports prices producers receive for the various goods and services they produce. The producer price index for all commodities (see —) decreased by 3.5 percent over the year ending March 2020, substantially below the 12-month growth rate of 0.8 percent in March 2019.

Inflation Expectations

Researchers gain insight on expected changes in prices through regular **surveys of consumers** and through **market data**. One market-based measure is known as the inflation breakeven and is calculated as the difference between the yield on a nominal treasury bond and the yield on a treasury inflation-protected bond of the same maturity. This difference represents the amount of inflation markets have priced in, on average, for the maturity of the bond.

5-year Expected Average Inflation
expected average annual rate, percent

Source: FRED; U. of Michigan

As of April 2020, consumers expect an average inflation rate of 2.5 percent over the next five years, (see —), compared to an expected rate of 2.3 percent in April 2019. Consumers had expected inflation to average 2.6 percent over the past five years, while actual inflation over the period was 1.7 percent.

As of May 12, 2020, markets expect an average inflation rate of 0.72 percent over the next five years (see —), compared to an expected rate of 1.73 percent on May 13, 2019. Markets had expected inflation to average 1.69 percent over the past five years, five years ago.

Import/Export Price Index

According to the Bureau of Labor Statistics, US import prices (see —) decreased by 4.1 percent over the 12 months ending March 2020, the lowest level since June 2016. Import prices decreased by 1.3 percent over the 12 months ending the month prior (February 2020). The latest value is substantially below the past-three-year average growth rate of 1.1 percent.

Prices of US exports (see —) decreased by 3.6 percent over the year ending March 2020, the lowest level since May 2016, and also substantially below its three-year moving average growth rate of 1.3 percent. Export prices decreased by 1.3 percent over the 12 months ending February 2020.
